REVISION HISTORY	

## Introduction

The Blackboard ships with a Zynq FPGA configuration containing IP blocks that let the processor communicate with all PL-connected devices using memory-mapped registers. This programmer's reference defines the AXI bus addresses and register contents for all IP blocks created in addition to the default Xilinx module's.

A Xilinx Vivado project that defines the IP blocks can be downloaded from the Real Digital website.

## Generic Interrupt Controller (GIC) [1]

#### Description

The ZYNQ chip has a single core ARM processor which has a Generic Interrupt Controller to process interrupts. Before configuring the GIC, you must ensure that you turned off your IRQ interrupts and that your processor has enough privileges to execute interrupts. This can be accomplished by configuring the ARM cortex v-7 A9 current processor status register (cpsr), see figure 1. ARM Cortex A9 has several modes which can be changed by reconfiguring the first four bits within the cpsr register. Bits 7 and 6 are necessary for masking the interrupts. For Blackboard, you need to configure the processor to System mode (0b11111) and set the IRQ and FIQ bits high to disable those interrupts. Examples in C are provided below on how you can enable/disable those interrupts.

Figure 1. Simple CPSR Register

#### Configure GIC

Before configuring the GIC, you need to locate which interrupt IDs you need to configure, you can look up IRQ ID values for specific modules within the Zynq chip from Zynq-7000 AP SoC Technical Reference Manual on page 230. [1] Configuring the Generic Interrupt Controller is a multistep process and requires some time to accomplish it. When broken down to doing it line by line, then there is a total of 9 steps you need to go through to set up the GIC for an interrupt:

- 1. Disable interrupt masks and any CPU's of handling interrupts (ICDIPTR and ICDICER)
- 2. Disable the distributor using Distributor Control Register (ICDDCR)
- 3. Set priority levels in the Interrupt Priority Register (ICDIPR)
- 4. Configure Interrupt Processor Targets Registers (ICDIPTR)
- 5. Set Interrupt Sensitivity in Interrupt Configuration Register (ICDICFR)
- 6. Enable Interrupts in the Interrupt Set-Enable Register (ICDISER)
- 7. Enable all priority levels in the Interrupt Priority Mask Register (ICCPMR)
- 8. Enable Interrupts in the CPU Interface Control Register (ICCICR)
- 9. Enable Distributor in the Distributor Control Register (ICDDCR)

When serving the interrupts, you need to determine the interrupt ID or IRQ ID by reading the Interrupt Acknowledge Register (ICCIAR) (Zynq-7000 AP SoC Technical Reference Manual page 1446). Then determine which interrupt it was such as Triple Timer Counter Match Interrupt, GPIO pin 16 interrupt, I2C data transfer completed interrupt, etc. Completely depends on your software program. Finally, clear any outstanding interrupt status bits and you need to notify the GIC that the interrupt has been served, which can be done by acknowledging the interrupt. Write the read value from ICCIAR register and write it to the End of Interrupt Register (ICCEOIR) (Zynq-7000 AP SoC Technical Reference Manual pages 1446 - 1447).

## **Overview of Registers\***

Base Address + Offset	Register	Reset Value	Access	Description
(hex)	Name	(hex)	Туре	
0xF8F00000 + 0x100	ICCICR	0x0	Read/Write	CPU Interface Control Register
0xF8F00000 + 0x104	ICCPMR	0x0	Read/Write	Interrupt Priority Mask Register
0xF8F00000 + 0x10C	ICCIAR	0x3FF	Read/Write	Interrupt Acknowledge Register
0xF8F00000 + 0x110	ICCEOIR	0x0	Read/Write	End of Interrupt Register
0xF8F00000 + 0x1000	ICDDCR	0x0	Read/Write	Distributor Control Register
0xF8F00000 + 0x1100	ICDISER0	0xFFFF	Read/Write	Interrupt Set-Enable Register 0
0xF8F00000 + 0x1104	ICDISER1	0x0	Read/Write	Interrupt Set-Enable Register 1
0xF8F00000 + 0x1108	ICDISER2	0x0	Read/Write	Interrupt Set-Enable Register 2
0xF8F00000 + 0x1180	ICDICER0	0x0	Read/Write	Interrupt Clear-Enable Register 0
0xF8F00000 + 0x1184	ICDICER1	0x0	Read/Write	Interrupt Clear-Enable Register 1
0xF8F00000 + 0x1188	ICDICER2	0x0	Read/Write	Interrupt Clear-Enable Register 2
0xF8F00000 + 0x1418	ICDIPR6	0x0	Read/Write	Interrupt Priority Register 6
0xF8F00000 + 0x1424	ICDIPR9	0x0	Read/Write	Interrupt Priority Register 9
0xF8F00000 + 0x1428	ICDIPR10	0x0	Read/Write	Interrupt Priority Register 10
0xF8F00000 + 0x142C	ICDIPR11	0x0	Read/Write	Interrupt Priority Register 11
0xF8F00000 + 0x1434	ICDIPR13	0x0	Read/Write	Interrupt Priority Register 13
0xF8F00000 + 0x1438	ICDIPR14	0x0	Read/Write	Interrupt Priority Register 14
0xF8F00000 + 0x1444	ICDIPR17	0x0	Read/Write	Interrupt Priority Register 17
0xF8F00000 + 0x1450	ICDIPR20	0x0	Read/Write	Interrupt Priority Register 20
0xF8F00000 + 0x1818	ICDIPTR6	0x0	Read/Write	Interrupt Processor Targets Register 6
0xF8F00000 + 0x1824	ICDIPTR9	0x0	Read/Write	Interrupt Processor Targets Register 9
0xF8F00000 + 0x1828	ICDIPTR10	0x0	Read/Write	Interrupt Processor Targets Register 10
0xF8F00000 + 0x182C	ICDIPTR11	0x0	Read/Write	Interrupt Processor Targets Register 11
0xF8F00000 + 0x1834	ICDIPTR13	0x0	Read/Write	Interrupt Processor Targets Register 13
0xF8F00000 + 0x1838	ICDIPTR14	0x0	Read/Write	Interrupt Processor Targets Register 14
0xF8F00000 + 0x1844	ICDIPTR17	0x0	Read/Write	Interrupt Processor Targets Register 17
0xF8F00000 + 0x1850	ICDIPTR20	0x0	Read/Write	Interrupt Processor Targets Register 20
0xF8F00000 + 0x1C04	ICDICFR1	0x55555555	Read/Write	Interrupt Configuration Register 1
0xF8F00000 + 0x1C08	ICDICFR2	0x55555555	Read/Write	Interrupt Configuration Register 2
0xF8F00000 + 0x1C0C	ICDICFR3	0x55555555	Read/Write	Interrupt Configuration Register 3
0xF8F00000 + 0x1C10	ICDICFR4	0x55555555	Read/Write	Interrupt Configuration Register 4
0xF8F00000 + 0x1C14	ICDICFR5	0x55555555	Read/Write	Interrupt Configuration Register 5

\* Note: This overview of registers doesn't include all interrupt ID registers, if other ID's are needed you can find them in Zynq-7000 AP SoC Technical Reference Manual 1432-1511 and 230-231.

## Registers

#### ICCICR (0xF8F00000 + 0x100) (GIC)

Name	Bit Range	Type	Reset	Description
Undefined	31:5	N/A	N/A	Bits 31:5 have no effect.
SBPR	4:4	R/W	0x0	<ul> <li>Controls whether the CPU interface uses the Secure or Non-Secure Binary Point Register for preemption.</li> <li>0: use the Secure Binary Point Register for Secure interrupts and use the Non-Secure Binary Point Register for Non-secure interrupts.</li> <li>1: use the Secure Binary Point Register for both Secure and Non-secure interrupts.</li> </ul>
FIQEn	3:3	R/W	0x0	Controls whether the GIC signals Secure interrupts to a target processor using the FIQ or the IRQ signal. 0: using IRQ, 1: using FIQ. The GIC always signals Non-secure interrupts using IRQ.
AckCtl	2:2	R/W	0x0	Controls whether a Secure read of the ICCIAR, when the highest priority pending interrupt is Non-secure, causes the CPU interface to acknowledge the interrupt.
EnableNS	1:1	R/W	0x0	An alias of the Enable bit in the Non-secure ICCICR. This alias bit means Secure software can enable the signal of Non-secure interrupts.
EnableS	0:0	R/W	0x0	Global enable for the signaling of Secure interrupts by the CPU interfaces to the connected processors.

#### ICDPMR (0xF8F00000 + 0x104) (GIC)

Name	Bit Range	Туре	Reset	Description
Undefined	31:8	N/A	N/A	Bits 31:8 have no effect.
Priority Mask	7:0	R/W	0x0	The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the processor.

#### <u>ICCIAR (0xF8F00000 + 0x10C) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:13	N/A	N/A	Bits 31:13 have no effect.
CPU_ID	12:10	R/W	0x0	Identifies the processor that requested the interrupt. Returns the number of the CPU interface that made the request.
IRQ ID or Interrupt ID	9:0	R/W	0x0	The interrupt ID. This read acts as an acknowledge for the interrupt if AckCtl bit is enabled within ICCICR register.

#### <u>ICCEOIR (0xF8F00000 + 0x110) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:13	N/A	N/A	Bits 31:13 have no effect.
CPU_ID	12:10	R/W	0x0	On completion of the processing of an SGI, this field contains the CPUID value from the corresponding ICCIAR access.
EOIINTID	9:0	R/W	0x0	The ACKINTID value from the corresponding ICCIAR
				access.

#### <u>ICDDCR (0xF8F00000 + 0x1000) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:2	N/A	N/A	Bits 31:2 have no effect.
Enable Non- Secure	1:1	R/W	0x0	0 = disables all Non-secure interrupts control bits in the distributor from changing state because of any external stimulus change that occurs on the corresponding SPI or PPI signals 1 = enables the distributor to update register locations for Non-secure interrupts
Enable Secure	0:0	R/W	0x0	<ul> <li>0 = disables all Secure interrupt control bits in the distributor from changing state because of any external stimulus change that occurs on the corresponding SPI or PPI signals.</li> <li>1 = enables the distributor to update register locations for Secure interrupts.</li> </ul>

#### ICDISER0 (0xF8F00000 + 0x1100) (GIC)

Name	Bit Range	Туре	Reset	Description
Set Enable 0	31:0	R/W	0x0	Writing 1 to a Set-enable bit enables forwarding of the corresponding interrupt to the CPU interfaces.
				Bits 31:0 correspond to interrupt IDs 31:0, respectively.

#### ICDISER1 (0xF8F00000 + 0x1104) (GIC)

Name	Bit Range	Туре	Reset	Description
Set Enable 1	31:0	R/W	0x0	Writing 1 to a Set-enable bit enables forwarding of the
				corresponding interrupt to the CPU interfaces.
				Bits 31:0 correspond to interrupt IDs 63:32, respectively.

#### ICDISER2 (0xF8F00000 + 0x1108) (GIC)

Name	Bit Range	Туре	Reset	Description
Set Enable 2	31:0	R/W	0x0	Writing 1 to a Set-enable bit enables forwarding of the
				corresponding interrupt to the CPU interfaces.
				Bits 31:0 correspond to interrupt IDs 95:64, respectively.

#### ICDICER0 (0xF8F00000 + 0x1180) (GIC)

Name	Bit Range	Туре	Reset	Description
Clear Enable 0	31:0	R/W	0x0	Writing 1 to a Clear-enable bit disables forwarding of the
				corresponding interrupt to the CPU interfaces.
				Bits 31:0 correspond to interrupt IDs 31:0, respectively.

#### <u>ICDICER1 (0xF8F00000 + 0x1184) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
Clear Enable 1	31:0	R/W	0x0	Writing 1 to a Clear-enable bit disables forwarding of the
				corresponding interrupt to the CPU interfaces.
				Bits 31:0 correspond to interrupt IDs 63:32, respectively.

#### <u>ICDICER2 (0xF8F00000 + 0x1188) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
Clear Enable 2	31:0	R/W	0x0	Writing 1 to a Clear-enable bit disables forwarding of the
				corresponding interrupt to the CPU interfaces.
				Bits 31:0 correspond to interrupt IDs 95:64, respectively.

#### <u>ICDIPR6 (0xF8F00000 + 0x1418) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
IRQ ID #27	31:24	R/W	0x0	Interrupt ID#27 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
Undefined	23:0	N/A	0x0	Reserved. Bits 23:0 have no effect.

#### <u>ICDIPR9 (0xF8F00000 + 0x1424) (GIC)</u>

Name	Bit Range	Type	Reset	Description
IRQ ID #39	31:24	R/W	0x0	Interrupt ID#39 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #38	23:16	R/W	0x0	Interrupt ID#38 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #37	15:8	R/W	0x0	Interrupt ID#37 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #36	7:0	R/W	0x0	Interrupt ID#36 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.

#### <u>ICDIPR10 (0xF8F00000 + 0x1428) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
IRQ ID #43	31:24	R/W	0x0	Interrupt ID#43 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #42	23:16	R/W	0x0	Interrupt ID#42 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #41	15:8	R/W	0x0	Interrupt ID#41 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #40	7:0	R/W	0x0	Interrupt ID#40 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.

#### <u>ICDIPR11 (0xF8F00000 + 0x142C) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
IRQ ID #47	31:24	R/W	0x0	Interrupt ID#47 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #46	23:16	R/W	0x0	Interrupt ID#46 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #45	15:8	R/W	0x0	Interrupt ID#45 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #44	7:0	R/W	0x0	Interrupt ID#44 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.

#### <u>ICDIPR13 (0xF8F00000 + 0x1434) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
IRQ ID #55	31:24	R/W	0x0	Interrupt ID#55 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #54	23:16	R/W	0x0	Interrupt ID#54 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #53	15:8	R/W	0x0	Interrupt ID#53 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #52	7:0	R/W	0x0	Interrupt ID#52 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.

#### ICDIPR14 (0xF8F00000 + 0x1438) (GIC)

Name	Bit Range	Туре	Reset	Description
IRQ ID #59	31:24	R/W	0x0	Interrupt ID#59 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #58	23:16	R/W	0x0	Interrupt ID#58 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #57	15:8	R/W	0x0	Interrupt ID#57 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #56	7:0	R/W	0x0	Interrupt ID#56 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.

#### <u>ICDIPR17 (0xF8F00000 + 0x1444) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
IRQ ID #71	31:24	R/W	0x0	Interrupt ID#71 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #70	23:16	R/W	0x0	Interrupt ID#70 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #69	15:8	R/W	0x0	Interrupt ID#69 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #68	7:0	R/W	0x0	Interrupt ID#68 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
-				the lower bits are always 0's.

#### <u>ICDIPR20 (0xF8F00000 + 0x1450) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
IRQ ID #83	31:24	R/W	0x0	Interrupt ID#83 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #82	23:16	R/W	0x0	Interrupt ID#82 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
				the lower bits are always 0's.
IRQ ID #81	15:8	R/W	0x0	Interrupt ID#81 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
-				the lower bits are always 0's.
IRQ ID #80	7:0	R/W	0x0	Interrupt ID#80 Priority Level.
Priority Level				Only the upper 5 bits of each 8-bit field are writable;
-				the lower bits are always 0's.

#### <u>ICDIPTR6 (0xF8F00000 + 0x1818) (GIC)</u>

Name	Bit Range	Type	Reset	Description
Undefined	31:26	N/A	N/A	Bits 31:26 have no effect.
IRQ ID #27	25:24	R	0x1	Targeted CPU(s) for interrupt ID#27 01: CPU 0 targeted 10: CPU 1 targeted
Undefined	23:0	N/A	N/A	Bits 23:18 have no effect.

## <u>ICDIPTR9 (0xF8F00000 + 0x1824) (GIC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:26	N/A	N/A	Bits 31:26 have no effect.
IRQ ID #39	25:24	R/W	0x0	Targeted CPU(s) for interrupt ID#39 00: no CPU targeted 01: CPU 0 targeted 10: CPU 1 targeted
				11: CPU 0 and CPU 1 are both targeted
Undefined	23:18	N/A	N/A	Bits 23:18 have no effect.
IRQ ID #38	17:16	R/W	0x0	Targeted CPU(s) for interrupt ID#38 00: no CPU targeted 01: CPU 0 targeted 10: CPU 1 targeted
				11: CPU 0 and CPU 1 are both targeted
Undefined	15:10	N/A	N/A	Bits 15:10 have no effect.
IRQ ID #37	9:8	R/W	0x0	Targeted CPU(s) for interrupt ID#37 00: no CPU targeted 01: CPU 0 targeted 10: CPU 1 targeted 11: CPU 0 and CPU 1 are both targeted
Undefined	7:2	N/A	N/A	Bits 7:2 have no effect.
IRQ ID #36	1:0	R/W	0x0	Targeted CPU(s) for interrupt ID#36 00: no CPU targeted 01: CPU 0 targeted 10: CPU 1 targeted 11: CPU 0 and CPU 1 are both targeted

## ICDIPTR10 (0xF8F00000 + 0x1828) (GIC)

Name	Bit Range	Туре	Reset	Description
Undefined	31:26	N/A	N/A	Bits 31:26 have no effect.
IRQ ID #43	25:24	R/W	0x0	Targeted CPU(s) for interrupt ID#43 00: no CPU targeted 01: CPU 0 targeted 10: CPU 1 targeted
				11: CPU 0 and CPU 1 are both targeted
Undefined	23:18	N/A	N/A	Bits 23:18 have no effect.

#### **Programming Examples in C**

#### Disable ARM Cortex v-7 A9 Interrupts (GIC)

```
void disable_ARM_A9_interrupts(){
    uint32_t mode = 0xDF; // System mode [4:0] and IRQ disabled [7]
    uint32_t read_cpsr=0; // used to read previous CPSR value
    uint32_t bit_mask = 0xFF; // used to clear bottom 8 bits
    __asm____volatile_("mrs %0, cpsr\n" : "=r" (read_cpsr));
    __asm____volatile_("msr_cpsr,%0\n" : : "r" ((read_cpsr & (~bit_mask))| mode));
    return;
}
```

Enable ARM Cortex v-7 A9 Interrupts (GIC)

```
void enable_ARM_A9_interrupts(){
    uint32_t read_cpsr=0; // used to read previous CPSR value
    uint32_t mode = 0x5F; // System mode [4:0] and IRQ enabled [7]
    uint32_t bit_mask = 0xFF; // used to clear bottom 8 bits
    __asm____volatile_("mrs %0, cpsr\n" : "=r" (read_cpsr));
    __asm____volatile_("msr_cpsr,%0\n" : : "r" ((read_cpsr & (~bit_mask))| mode));
    return;
}
```

#### Configure GIC Example (GIC)

```
void configure_GIC(){
    *((uint32_t*) ICDIPTR_BASEADDR+0x34/4) = 0x00000000; // Step 1
    *((uint32_t*) ICDICER_BASEDDR+0x04/4) = 0x00100000; // Step 1
    *((uint32_t*) ICDDCR_BASEADDR) = 0x0; // Step 2
    *((uint32_t*) ICDIPTR_BASEADDR+0x34/4) = 0x000000A0; // Step 3
    *((uint32_t*) ICDIPTR_BASEADDR+0x34/4) = 0x00000001; // Step 4
    *((uint32_t*) ICDICFR_BASEADDR+0x2/4) = 0x5555555; // Step 5
    *((uint32_t*) ICDISER_BASEADDR+0x4/4) = 0x00100000; // Step 6
    *((uint32_t*) ICDISER_BASEADDR) = 0xFF; // Step 7
    *((uint32_t*) ICCICR_BASEADDR) = 0x3; // Step 8
    *((uint32_t*) ICDICFR_BASEADDR) = 0x1; // Step 9
    return;
```

```
}
```

#### Serving Interrupts (Exception Handler) (GIC)

When an exception happens, processor execution is forced to an address that corresponds to the type of exception. This address is called the exception vector for that exception and a total of 8 exceptions form the vector table that is represented in the following figure.

055-14	Vector tables							
Offset	Нура	Monitor <sup>b</sup>	Secure	Non-secure				
0x00	Not used	Not used	Reset	Not used				
0x04	Undefined Instruction, from Hyp mode	Not used	Undefined Instruction	Undefined Instruction				
0x08	Hypervisor Call, from Hyp mode	Secure Monitor Call	Supervisor Call	Supervisor Call				
0x0C	Prefetch Abort, from Hyp mode	Prefetch Abort	Prefetch Abort	Prefetch Abort				
0x10	Data Abort, from Hyp mode	Data Abort	Data Abort	Data Abort				
0x14	Hyp Trap, or Hyp mode entry <sup>c</sup>	Not used	Not used	Not used				
0x18	IRQ interrupt	IRQ interrupt	IRQ interrupt	IRQ interrupt				
0x1C	FIQ interrupt	FIQ interrupt	FIQ interrupt	FIQ interrupt				

a. Non-secure state only. Implemented only if the implementation includes the Virtualization Extensions.

b. Secure state only. Implemented only if the implementation includes the Security Extensions.

c. See Use of offset 0x14 in the Hyp vector table on page B1-1168.

```
Figure 2. ARM A9 Vector Table (DDI0406C Arm Architecture Reference Manual ARMv7-A and ARMv7-R edition Section B 1.8 on Page 1166) [2]
```

Before you're able to set up an exception handler or an interrupt handler to serve the interrupts you've configured, exception vector table initialization needs to take place, which is already done for you in asm\_vectors.S file by Xilinx. Lines 68-79 within asm\_vectors.S assembly file represent the vector table setup.

.globl \_vector\_table

.section .vectors
\_vector\_table:

В	_boot
В	Undefined
В	SVCHandler
В	PrefetchAbortHandler
В	DataAbortHandler
NOP	<pre>/* Placeholder for address exception vector*/</pre>
В	IRQHandler
В	FIQHandler

Now, every time an interrupt occurs the processor is forced to branch to IRQHandler function which can be found within asm\_vectors.S lines 82-100 (found below). The IRQHandler saves processor register to stack and calls the routine "IRQInterrupt" in line 100.

IRQHandler:	/* IRQ vector handler */
<pre>stmdb sp!,{r0-r3,r12,lr} #ifdefARM_NEON vpush {d0-d7} vpush {d16-d31} vmrs r1, FPSCR push {r1} vmrs r1, FPEXC push {r1} #endif</pre>	/* state save from compiled code*/
<pre>#ifdef PROFILING     ldr r2, =prof_pc     subs r3, lr, #0     str r3, [r2] #endif</pre>	
bl IRQInterrupt	/* IRQ vector */

Now that the IRQInterrupt function has been called in vectors.c file every time an interrupt happens, it will call a structure XExc\_VectorTable defined using XExc\_VectorTableEntry struct.

```
} XExc_VectorTableEntry;
```

Where Xil\_ExceptionHandler is defined as

typedef void (\*Xil\_ExceptionHandler)(void \*data);

and where XIL\_EXCEPTION\_ID\_IRQ\_INT is defined within xil\_exception.h header file as

<pre>#define</pre>	XIL_EXCEPTION_ID_RESET		0U
<pre>#define</pre>	XIL_EXCEPTION_ID_UNDEFINED_INT		10
<pre>#define</pre>	XIL_EXCEPTION_ID_SWI_INT	20	
<pre>#define</pre>	XIL_EXCEPTION_ID_PREFETCH_ABORT	_INT	3U
<pre>#define</pre>	XIL_EXCEPTION_ID_DATA_ABORT_INT		40
<pre>#define</pre>	XIL_EXCEPTION_ID_IRQ_INT	<mark>50</mark>	
#define	XIL_EXCEPTION_ID_FIQ_INT	6U	
#define	XIL_EXCEPTION_ID_LAST		6U

All of this allows you to set up and interrupt handler named by your own choice. Setting up an interrupt handler can be done using Xilinx's built-in function that also requires "xil\_exception.h" header to be included in your code:

Xil\_ExceptionRegisterHandler(u32 Exception\_ID, Xil\_ExceptionHandler Handler, void \*Data)

Where the function simply connects the name of the handler to the corresponding exception ID in

XExc\_VectorTable. This means that every time an interrupt occurs, **IRQInterrupt** is called that, which then calls the Handler corresponding to the Exception\_ID. The exception ID can be chosen based on what type of interrupts you want to serve, i.e 0x5 corresponds to IRQ\_ID, which is used in this example. The handler associated with this IRQ\_ID can be named whatever you would prefer, but for this example it is named as IRQ\_Handler. You should have this line of code in your main function to create the interrupt handler:

Xil\_ExceptionRegisterHandler(5, IRQ\_Handler, NULL);

You will then need to set up a function named IRQ\_Handler to serve the interrupts with the following syntax:

```
void IRQ_Handler(void *data){
```

```
/* Handle the interrupt here */
}
```

IRQ Handler Using MIO Buttons and LED (GIC)

```
void IRQ_Handler(void *data){
    uint32_t GPI0_INT = *((uint32_t*)GPI0_INT_STAT_1);
    uint32_t interrupt_ID = *((uint32_t*)ICCIAR_BASEADDR);
    uint32_t button_press = 0xC0000 & GPI0_INT;
    if (interrupt_ID == 52) { // check if interrupt is from the GPI0
        if (button_press == 0x80000){
            *((uint32_t*) GPI0_MTDATA_OUT_0) = 0xFFF80001;
        }
    }
```

## General Purpose I/O (GPIO) Module [1]

#### Description

Xilinx's GPIO module is used to control the GPIO channels of the Zynq chip on Blackboard. For example, MIO pins can be configured as inputs or outputs, which can then be used to read a button press or set a color of an LED. This completely depends on your design, GPIO module also gives you the capability to set up interrupts for those specific pins. Next section, Overview of Registers, doesn't include all registers within the Xilinx's GPIO module, but it brings out some registers that can be used to set up Blackboard's MIO buttons and MIO RGB LED with interrupts. More registers can be found within the Zynq All Programmable SoC Technical Reference Manual.

#### **Overview of Registers**

Base Address + Offset	Register Name	Reset Value	Access Type	Description
(hex)		(hex)		
0xE000A000 + 0x04	<u>GPIO_MTDATA_OUT_0</u>	0x0	Read/Write	Maskable Output Data Bank 0
0xE000A000 + 0x204	<u>GPIO_DIRM_0</u>	0x0	Read/Write	Direction Mode for Bank 0
0xE000A000 + 0x208	<u>GPIO_OUTE_0</u>	0x0	Read/Write	Output Enable for Bank 0
0xE000A000 + 0x214	<u>GPIO_INT_DIS_0</u>	0x0	Write Only	Interrupt Disable Bank 0
0xE000A000 + 0x244	<u>GPIO_DIRM_1</u>	0x0	Read/Write	Direction Mode for Bank 1
0xE000A000 + 0x250	<u>GPIO INT EN 1</u>	0x0	Write Only	Interrupt Enable Bank 1
0xE000A000 + 0x254	<u>GPIO_INT_DIS_1</u>	0x0	Write Only	Interrupt Disable Bank 1
0xE000A000 + 0x258	GPIO_INT_STAT_1	0x0	Read/Write	Interrupt Status Bank 1
0xE000A000 + 0x25C	<u>GPIO_INT_TYPE_1</u>	0x0	Read/Write	Interrupt Type Bank 1
0xE000A000 + 0x260	<u>GPIO_INT_POL_1</u>	0x0	Read/Write	Interrupt Polarity Bank 1
0xE000A000 + 0x264	<u>GPIO INT ANY 1</u>	0x0	Read/Write	Interrupt Sensitivity Bank 1

### Registers

#### <u>GPIO\_MTDATA\_OUT\_0 (0xF8F00000 + 0x04) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
MASK_0_MSW	31:16	W	0x0	On a write, only bits with a corresponding de-asserted mask will change the output value. 0: pin value is updated 1: pin is masked Each bit controls the corresponding pin within MIO pins [31:16].
DATA_0_MSW	15:0	R/W	N/A	On a write, these are the data values for the corresponding GPIO output bits. Each bit controls the corresponding pin within the 16-bit half-bank. Reads return the previous value written to this register or DATA_0[15:0]. Corresponds to MIO pins [31:16]. Reads do not return the value on the GPIO pin

#### <u>GPIO\_DIRM\_0 (0xE000A000 + 0x204) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Direction Mode	31:0	R/W	0x0	Direction mode
Bank 0				0: input
				1: output
				Each bit configures the corresponding pin within bank 0,
				MIO pins [31:0]

#### <u>GPIO\_OUTE\_0 (0xE000A000 + 0x208) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Output Enable	31:0	R/W	0x0	Output enables
Bank 0				0: disabled
				1: enabled
				Each bit configures the corresponding pin within bank 0,
				MIO pins [31:0]

#### <u>GPIO\_INT\_DIS\_0 (0xE000A000 + 0x214) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Interrupt Disable	31:0	W	0x0	Interrupt disable
Bank 0				0: no change
				1: clear interrupt mask (enable interrupt)
				Each bit configures the corresponding pin within bank 1,
				MIO pins [31:0]

#### <u>GPIO\_DIRM\_1 (0xE000A000 + 0x244) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:22	N/A	N/A	Bits 31:22 have no effect.
Direction Mode	21:0	R/W	0x0	Direction mode
Bank 1				0: input
				1: output
				Each bit configures the corresponding pin within bank 1,
				MIO pins [53:32]

#### <u>GPIO\_INT\_EN\_1 (0xE000A000 + 0x250) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:22	N/A	N/A	Bits 31:22 have no effect.
Interrupt Enable Bank 1	21:0	W	0x0	Interrupt enable 0: no change 1: clear interrupt mask (enable interrupt) Each bit configures the corresponding pin within bank 1, MIO pins [53:32].

#### <u>GPIO\_INT\_DIS\_1 (0xE000A000 + 0x254) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:22	N/A	N/A	Bits 31:22 have no effect.
Interrupt Disable Bank 1	21:0	W	0x0	Interrupt disable 0: no change 1: clear interrupt mask (enable interrupt) Each bit configures the corresponding pin within bank 1, MIO pins [53:32].

#### <u>GPIO\_INT\_STAT\_1 (0xE000A000 + 0x258) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:22	N/A	N/A	Bits 31:22 have no effect.
Interrupt Status Bank 1	21:0	R/W	0x0	Interrupt status Upon read: 0: no interrupt 1: interrupt event has occurred Upon write: 0: no action 1: clear interrupt status bit Each bit configures the corresponding pin within the 22- bit bank 1 (MIO pins [53:32]).

#### <u>GPIO\_INT\_TYPE\_1 (0xE000A000 + 0x25C) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:22	N/A	N/A	Bits 31:22 have no effect.
Interrupt Type Bank 1	21:0	R/W	0x0	Interrupt type 0: level-sensitive 1: edge-sensitive Each bit configures the corresponding pin within the 22- bit bank 1 (MIO pins [53:32]).

#### <u>GPIO\_INT\_POL\_1 (0xE000A000 + 0x260) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:22	N/A	N/A	Bits 31:22 have no effect.
Interrupt Polarity Bank 1	21:0	R/W	0x0	Interrupt polarity 0: active low or falling edge 1: active high or rising edge Each bit configures the corresponding pin within the 22- bit bank 1 (MIO pins [53:32]).

#### <u>GPIO\_INT\_ANY\_1 (0xE000A000 + 0x264) (GPIO)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:22	N/A	N/A	Bits 31:22 have no effect.
Interrupt Any Sensitive Bank 1	21:0	R/W	0x0	Interrupt edge triggering mode 0: trigger on single edge, using configured interrupt polarity 1: trigger on both edges Each bit configures the corresponding pin within the 22- bit bank 1 (MIO pins [53:32]).

#### **Programming Examples in C**

#### Initialize GPIO Pin (GPIO)

```
void Initialize_IOs(){
    *((uint32_t*) GPI0_DIRM_0) = 0x00070000;
    *((uint32_t*) GPI0_OUTE_0) = 0x00070000;
    *((uint32_t*) GPI0_DIRM_1) = 0x00000000;
    return;
}
```

Initialize GPIO Interrupts (GPIO)

```
void Initialize_GPI0_Interrupts(){
      // Step 1: Disable interrupts
      *((uint32 t*) GPIO INT DIS 1) = 0xFFFFFFF;
      *((uint32_t*) GPIO_INT_DIS_0) = 0xFFFFFFF;
      // Step 2:
      *((uint32 t*) GPIO INT STAT 1) = 0xFFFFFFFF; // Clear Status register
      // Step 3:
      *((uint32 t*) GPIO INT TYPE 1) = 0x000000; // Type of interrupt rising edge
      // Step 4:
      *((uint32_t*) GPI0_INT_POL_1) = 0x0C0000; // Polarity of interrupt
      // Step 5:
      *((uint32_t*) GPIO_INT_ANY_1) = 0x000000; // Interrupt any edge sensitivity
      // Step 6:
      *((uint32_t*) GPIO_INT_EN_1) = 0x0C0000; // Enable interrupts in bank 0
      *((uint32 t*) GPIO MTDATA OUT 0) = 0xFFF80000; // Set LEDs to 0
}
```

#### Serving GPIO Interrupts (GPIO)

Example of serving GPIO interrupts can be found here.

## Global Timer Counter (GTC) Module [1]

## Description

Xilinx's GTC module is deigned to control ARM Cortex-A9 MPCore 64-bit global timer with an auto-increment feature. More information about Cortex-A9 MPCore Global Timer can be found in Xilinx's Zynq SoC All Programmable reference manual under "Global Timer" Section.

#### **Overview of Registers**

Base Address + Offset	Register Name	Reset Value	Access Type	Description
(hex)		(hex)		
0xF8F00000 + 0x200	Global Timer	0x0	Read/Write	Global Timer Counter
	Counter Register 0			Register 0
0xF8F00000 + 0x204	Global Timer	0x0	Read/Write	Global Timer Counter
	Counter Register 1			Register 1
0xF8F00000 + 0x208	Global Timer	0x0	Read/Write	Global Timer Control
	Control Register			Register
0xF8F00000 + 0x20C	Global Timer	0x0	Read/Write	Global Timer Interrupt
	Interrupt Status			Status Register
	Register			_
0xF8F00000 + 0x210	Comparator Value 0	0x0	Read/Write	Comparator Value
				Register 0
0xF8F00000 + 0x214	Comparator Value 1	0x0	Read/Write	Comparator Value
				Register 1
0xF8F00000 + 0x218	Auto Increment	0x0	Read/Write	Auto Increment Register
	Register			C C

## Registers

#### <u>Global Timer Counter Register 0 (0xF8F00000 + 0x200) (GTC)</u>

Name	Bit Range	Туре	Reset	Description
Global Timer	31:0	R/W	0x0	Lower 32 bits of the 64-bit Global Timer Counter.
Counter Register 0				You must access these registers with 32-bit
				accesses. To modify the register:
				1. Clear the timer enable bit in the Global
				Timer Control Register
				2. Write lower 32-bit Global Timer Counter
				Register 0
				3. Write upper 32-bit Global Timer Counter
				Register 1
				4. Set Timer Enable
				To read value from the register:
				1. Read the upper 32-bit Global Timer
				Counter Register 1
				2. Read the lower 32-bit Global Timer
				Counter Register 0

## Global Timer Counter Register 1 (0xF8F00000 + 0x204) (GTC)

Name	Bit Range	Type	Reset	Description
Global Timer	31:0	R/W	0x0	Upper 32 bits of the 64-bit Global Timer Counter.
Counter Register 1				You must access these registers with 32-bit
_				accesses. To modify the register:
				1. Clear the timer enable bit in the Global
				Timer Control Register
				2. Write lower 32-bit Global Timer Counter
				Register 0 value
				3. Write upper 32-bit Global Timer Counter
				Register 1 value
				4. Set Timer Enable
				To read value from the register:
				1. Read the upper 32-bit Global Timer
				Counter Register 1
				2. Read the lower 32-bit Global Timer
				Counter Register 0

## Global Timer Control Register (0xF8F00000 + 0x208) (GTC)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
Prescaler	15:8	R/W	0x0	The prescaler modifies the clock period for the decrementing event for the Counter Register. The timer interval is calculated using the following equation: (PRESCALER_value+1)*(Load_value+1)*(CPU_3x2x PERIOD). CPU_3x2x frequency is 333.3333MHz (always half of CPU frequency).
Undefined	7:4	N/A	N/A	Bits 7:4 have no effect.
Mode	3:3	R/W	0x0	<ul> <li>0 = When the counter reaches the comparator value, sets the event flag. It is the responsibility of software to update the comparator value to get further events.</li> <li>1 = Each time the counter reaches the comparator value, the comparator register is incremented with the auto-increment register, so that further events can be set periodically without any software updates.</li> </ul>
IRQ_Enable	2:2	R/W	0x0	0 = Interrupt disabled 1 = Interrupt enabled Interrupt ID for Global Timer is ID#27
Comparator Enable	1:1	R/W	0x0	Allows comparison between the 64-bit timer counter and the related 64-bit comparator register. 0 = Comparison disabled 1 = Comparison enabled
Timer Enable	0:0	R/W	0x0	0 = Timer Disabled 1 = Timer Enabled

## <u>Global Timer Interrupt Status Register (0xF8F00000 + 0x20C) (GTC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:1	N/A	N/A	Bits 31:1 have no effect.
Interrupt Flag	0:0	R/W	0x0	The event flag is a sticky bit that is automatically set when the Counter Register reaches the Comparator Register value. If the timer interrupt is enabled, Interrupt ID 27 is set as pending in the Interrupt Distributor after the event flag is set. The event flag is cleared when written to 1.

#### Comparator Register 0 (0xF8F00000 + 0x210) (GTC)

Name	Bit Range	Type	Reset	Description
Global Timer	31:0	R/W	0x0	Lower 32 bits of the 64-bit Global Timer
Counter Register 0				Comparator. You must access these registers with
				32-bit accesses. To modify the register:
				1. Clear the compare enable bit in the timer
				control register
				2. Write the lower 32-bit Global Timer
				Comparator value
				3. Write upper 32-bit Global Timer
				Comparator value
				4. Set comparator enable bit and the interrupt
				enable bit if necessary.

#### Comparator Register 1 (0xF8F00000 + 0x214) (GTC)

Name	Bit Range	Туре	Reset	Description
Global Timer	31:0	R/W	0x0	Upper 32 bits of the 64-bit Global Timer
Counter Register 1				Comparator. You must access these registers with
				32-bit accesses. To modify the register:
				1. Clear the compare enable bit in the timer control register
				2. Write the lower 32-bit Global Timer
				Comparator value
				3. Write upper 32-bit Global Timer
				Comparator value
				Set comparator enable bit and the interrupt enable
				bit if necessary. To read value from the register:
				1. Read the upper 32-bit Global Timer Counter
				Register 1
				2. Read the lower 32-bit Global Timer Counter
				Register 0

#### Auto Increment Register (0xF8F00000 + 0x218) (GTC)

Name	Bit Range	Туре	Reset	Description
Auto Increment	31:0	R/W	0x0	Auto-increment Register This 32-bit register gives
Value				the increment value of the Comparator Register when
				the Auto-increment bit is set in the Timer Control
				Register.
				If the comparator enable and auto-increment bits are
				set when the global counter reaches the Comparator
				Register value, the comparator is incremented by the
				auto-increment value, so that a new event can be set
				periodically.
				The global timer is not affected and goes on
				incrementing.

## **H-Bridge Module**

#### Description

The H-Bridge IP block is a single-channel controller designed specifically for Digilent's HB5 Pmod. This IP has a total of 5 registers that can be used to control the H bridge. Figure below represents a block diagram of inputs and outputs of how this IP is functioning. An overview and complete description of all the registers within this IP is presented in the following sections. Also, an example of how to program/configure this IP is presented as well.

Figure 3 H-Bridge block diagram

#### **Overview of Registers**

Base Address +	Register Name	Reset Value	Access Type	Description
Offset (hex)		(hex)		
0x4BB05000 + 0x00	HB_EN	0x0	Read/Write	Enable H-Bridge
0x4BB05000 + 0x04	HB_DIR	0x0	Read/Write	Direction of rotation
0x4BB05000 + 0x08	HB_SPEED	0x0	Read/Write	Adjust the speed of the motor
0x4BB05000 + 0x0C	HB_ENC_EN	0x0	Read/Write	Enable encoder for RPM
				readings
0x4BB05000 + 0x10	HB RPM READ	N/A	Read	Read the raw RPM value

# Registers

### <u>HB\_EN (0x4BB05000 + 0x00) (HB)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:1 have no effect.
H-Bridge Enable	0:0	R/W	0x0	This bit is used to enable the H-Bridge system. Writing a 1 to this bit enables the H-Bridge.

## <u>HB\_DIR (0x4BB05000 + 0x04) (HB)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:1	N/A	N/A	Bits 31:1 have no effect.
Motor Rotation	0:0	R/W	0x0	This bit is used choose the direction of rotation. Writing
Direction				0 or 1 to this register corresponds to clockwise or
				counter clockwise rotation of the motor, respectively.

## <u>HB\_SPEED (0x4BB05000 + 0x08) (HB)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:10	N/A	N/A	Bits 31:10 have no effect.
Motor Speed Control	9:0	R/W	0x0	Writing into these bits will define the PWM duty cycle of the motor; 0x3FF being the maximum value and 0x000 the lowest value.

#### <u>HB\_ENC\_EN (0x4BB05000 + 0x0C) (HB)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:1	N/A	N/A	Bits 31:1 have no effect.
RPM Enable	0:0	R/W	0x0	This bit is used to choose to enable/start a RPM reading while the HB EN is high Writing a 1 to this enables
				and starts the RPM reading.

#### <u>HB\_RPM\_READ</u> (0x4BB05000 + 0x10) (HB)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
Read raw RPM	15:0	R	0x0	This is a read only register; writes have no effect.
value				Reading from this register returns a half word that represents the raw value of RPM. Raw RPM value can be used to calculate the final RPM value using the following equation: $RPM = \left(\frac{1MHz}{RPM_{raw}*GearRatio}\right) * \frac{60s}{min}$

#### **Programming Example in C (HB)**

```
#include <stdio.h>
#define H BRIDGE BASEADDR 0x4BB05000 //Define HB IP base address
int final_rpm(int gear ratio);
int main() {
    // Declare volatile integer i and rpm
    volatile int i = 0;
    volatile int rpm = 0;
    *((uint32_t *) H_BRIDGE_BASEADDR) = 0x01; //Enable HB_IP
    *((uint32 t *) H BRIDGE BASEADDR+0x01) = 0x1; // Set DC motor direction bit as 1
    *((uint32_t *) H_BRIDGE_BASEADDR+0x02) = 0x15F; // Set speed value as 0x2FF
    for (i = 0; i < 200000000; i++); // Delay. Wait until motor stabilizes before getting
the RPM value
    rpm = final_rpm(53); // gear ratio is 53:1
    printf("Final RPM value is %d\n", rpm);
    return 1;
}
int final_rpm(int gear_ratio){
      volatile int i = 0;
      volatile int rpm_raw = 0; // Store raw RPM value here
      volatile int rpm = 0; // Store final RPM value here
      /*
       * As soon as the encoder is enabled, a raw RPM value is generated,
       * to read another raw RPM value, the encoder enable bit
       * must be set to 0 and then 1 again
      */
      *((uint32_t *) H_BRIDGE_BASEADDR+0x03) = 0x1; // Enable Encoder to get RPM value
      for (i = 0; i < 10000000; i++); // short delay to wait until value has been
                                       // sto in read register
      rpm_raw = *((uint32_t *) H_BRIDGE_BASEADDR+0x04); // Read the Raw RPM value
      rpm = 60*1000000/(rpm raw*gear ratio); // calculate final RPM value
      *((uint32 t *) H BRIDGE BASEADDR+0x03) = 0x0; // Disable Encoder
      return rpm;
}
```

# iNEMO Inertial Module (NAV Sensor) [3]

## Description

SPI Accelerometer, Gyroscope and Magnetometer module is configured to read and write data into 9-axis navigation sensor LSM9DS1. LSM9DS1 is a system-in-package (SiP) featuring a 3-axis digital acceleration sensor, a 3-axis digital angular rate sensor, and a 3-axis digital magnetic sensor. Each axis has 16-bit full scale registers, which enable the user to figure out which direction they are facing, if they are tilted, or what is the magnetic field around them.

You can configure the SiP to have the following features:

- $\pm 2/\pm 4/\pm 8/\pm 16$  g linear acceleration full scale
- $\pm 4/\pm 8/\pm 12/\pm 16$  gauss magnetic full scale
- $\pm 245/\pm 500/\pm 2000$  dps angular rate full scale

The module can be accessed using Xilinx's SPIO Controller Module.

#### SPI Read (Accelerometer/Gyroscope) (NAV)

The SPI read is executed with 16 clock pulses (Figure 4). Also, multiple byte read command can be performed by adding 8 clock pulses (Figure 5). "When the CTRL\_REG8 (22h) (IF\_ADD\_INC) bit is '0' the address used to read/write data remains the same for every block. When the CTRL\_REG8 (22h) (IF\_ADD\_INC) bit is '1', the address used to read/write data is increased at every block." [3]

- Bit 0 = 1 (READ bit)
- Bits 1-7 = address AD(6:0). Address of the register.
- Bits 8-15: data DO(7:0) (read mode). Data read from the device (Most significant bit of the byte first)
- Bits 16-...: data DO(...-8). Further data

Figure 4. SPI single byte read (Accelerometer/Gyroscope) [3]

Figure 5. Multiple byte SPI read (2 Bytes, Accelerometer/Gyroscope) [3]

#### SPI Write (Accelerometer/Gyroscope) (NAV)

The SPI write is executed with 16 clock pulses (Figure 6). Also, multiple byte write command can be performed by adding 8 clock pulses (Figure 7).

- Bit 0 = 0 (WRITE bit)
- Bits 1-7 =address AD(6:0). Address of the register.
- Bits 8-15: data DO(7:0) (write mode). Data written to the sensor registers (Most significant bit of the byte first).
- Bits 16-...: data DO(...-8). Further data.

Figure 6. SPI single byte write (Accelerometer/Gyroscope) [3]

Figure 7. Multiple byte SPI write (2 Bytes, Accelerometer/Gyroscope) [3]

#### SPI Read (Magnetometer) (NAV)

Like SPI read execution for Accelerometer/Gyroscope, the command for Magnetometer is performed with 16 clock pulses (figure 8). A multiple byte read command can be performed by adding an additional of 8 clock pulses (figure 9).

- Bit 0 = 1 (READ bit)
- Bit  $1 = M\overline{S}$  bit. If this bit = 0, address is not incremented; when bit = 1, address is incremented in multiple byte reads.
- Bits 2-7 =address AD(6:0). Address of the register.
- Bits 8-15: data DO(7:0) (read mode). Data read from the device (Most significant bit of the byte first)
- Bits 16-...: data DO(...-8). Further data

Figure 9. SPI multiple byte read (2 bytes, Magnetometer) [3]

#### SPI Write (Magnetometer) (NAV)

SPI write command for Magnetometer is performed with 16 clock pulses (figure 10). A multiple byte write execution can be performed by adding an additional of 8 clock pulses (figure 11).

- Bit 0 = 0 (WRITE bit)
- Bit  $1 = \overline{MS}$  bit. If this bit = 0, address is not incremented; when bit = 1, address is incremented in multiple byte reads.
- Bits 2-7 =address AD(6:0). Address of the register.
- Bits 8-15: data DO(7:0) (write mode). Data written to the sensor registers (Most significant bit of the byte first).
- Bits 16-...: data DO(...-8). Further data.

Figure 11. Multiple byte SPI write (2 Bytes, Magnetometer) [3]

# Registers: Accelerometer and Gyroscope (CS Line 0) [3] (NAV)

Register	Register Name	Reset Value	Access	Description
Address (hex)		(hex)	Туре	
0x0F	WHO_AM_I	0x68	Read	Default ID value of Accelerometer and Gyroscope module.
0x10	CTRL_REG1_G	0x10	Read/Write	<ul> <li>Activates Accelerometer + Gyroscope when default value of register has been changed based on one of these options:</li> <li>245 dps register value: 0x20 (hex)</li> <li>500 dps register value: 0x28 (hex)</li> <li>2000 dps register value: 0x38 (hex)</li> </ul>
0x15	OUT_TEMP_L	Output	Read	Temperature data output register. L and H registers together express a 16-bit word in two's complement. Total temperature value
0x16	OUT_TEMP_H	Output	Read	is represented in 12 bits [11:0] where bit 11 is the sign bit. Bits [15:12] are sign extend of bit 11.
0x18	OUT_X_L_G	Output	Read	Angular rate sensor X-axis angular rate output register. The value is expressed as 16-bit word in two's complement.
0x19	OUT_X_H_G	Output	Read	OUT_X_L_G represents the bottom 8 bits [7:0] of the half word and OUT_X_H_G represent the top 8 bits [15:8] of the half- word.
0x1A	OUT_Y_L_G	Output	Read	Angular rate sensor Y-axis angular rate output register. The value is expressed as 16-bit word in two's complement.
0x1B	OUT_Y_H_G	Output	Read	OUT_Y_L_G represents the bottom 8 bits [7:0] of the half word and OUT_Y_H_G represent the top 8 bits [15:8] of the half- word.
0x1C	OUT_Z_L_G	Output	Read	Angular rate sensor Z-axis angular rate output register. The value is expressed as 16-bit word in two's complement.
0x1D	OUT_Z_H_G	Output	Read	[7:0] of the half word and OUT_Z_H_G represent the top 8 bits [15:8] of the half- word.

# Gyroscope (Angular Rate Sensor) (NAV)

# Accelerometer (Linear Acceleration Sensor) (NAV)

Register	Register Name	Reset Value	Access	Description
Address (hex)		(hex)	Туре	
0x20	CTRL_REG6_XL	0x20	Read/Write	Activates only Accelerometer sensor when default value of register has been changed to one of these options: ±2g register value: 0x20 (hex) ±4g register value: 0x30 (hex) ±8g register value: 0x38 (hex) ±16g register value: 0x28 (hex).
0x22	CTRL_REG8	0x04	Read/Write	Control Register 8. By default, register address is automatically incremented during multiple byte access with a serial interface. Write 0x00 into this register to disable register automatic incrementation.
0x28	OUT_X_L_XL	Output	Read	Linear acceleration sensor X-axis output register. The value is expressed as 16-bit word in two's complement. OUT_X_L_XL
0x29	OUT_X_H_XL	Output	Read	represents the bottom 8 bits [7:0] of the half word and OUT_X_H_XL represent the top 8 bits [15:8] of the half-word.
0x2A	OUT_Y_L_XL	Output	Read	Linear acceleration sensor Y-axis output register. The value is expressed as 16-bit word in two's complement. OUT_Y_L_XL
0x2B	OUT_Y_H_XL	Output	Read	represents the bottom 8 bits [7:0] of the half word and OUT_Y_H_XL represent the top 8 bits [15:8] of the half-word.
0x2C	OUT_Z_L_XL	Output	Read	Linear acceleration sensor Z-axis output register. The value is expressed as 16-bit word in two's complement. OUT_Z_L_XL
0x2D	OUT_Z_H_XL	Output	Read	represents the bottom 8 bits [7:0] of the half word and OUT_Z_H_XL represent the top 8 bits [15:8] of the half-word.

# Registers: Magnetometer (CS Line 1) [3] (<u>NAV</u>)

Register	Register Name	Reset Value	Access	Description
Address (hex)		(hex)	Туре	
0x05	OFFSET_X_L_M	0x00	Read/Write	This register is a 16-bit register (L and H together) and represents the X offset used to compensate environmental effects (data
0x06	OFFSET_X_H_M	0x00	Read/Write	as two's complement). This value acts on the magnetic output data value to subtract the environmental offset.
0x07	OFFSET_Y_L_M	0x00	Read/Write	This register is a 16-bit register (L and H together) and represents the Y offset used to compensate environmental effects (data
0x08	OFFSET_Y_H_M	0x00	Read/Write	as two's complement). This value acts on the magnetic output data value to subtract the environmental offset.
0x09	OFFSET_Z_L_M	0x00	Read/Write	This register is a 16-bit register (L and H together) and represents the Z offset used to compensate environmental effects (data
0x0A	OFFSET_Z_H_M	0x00	Read/Write	as two's complement). This value acts on the magnetic output data value to subtract the environmental offset.
0x0F	WHO_AM_I	0x3D	Read	Default ID value of Magnetometer module.
0x21	CTRL_REG2_M	0x00	Read/Write	Magnetometer Full Scale Selection ±4gauss register value: 0x00 (hex) ±8gauss register value: 0x20 (hex) ±12gauss register value: 0x40 (hex) ±16gauss register value: 0x60 (hex).
0x22	CTRL_REG3_M	0x03	Read/Write	Activates Magnetometer with continuous conversion mode when default value of register has been changed to 00 (hex)
0x28	OUT_X_L_M	Output	Read	Magnetic sensor X-axis output register. The value is expressed as 16-bit word in two's complement. OUT X L M
0x29	OUT_X_H_M	Output	Read	represents the bottom 8 bits $[7:0]$ of the half word and OUT_X_H_M represent the top 8 bits $[15:8]$ of the half-word.
0x2A	OUT_Y_L_M	Output	Read	Magnetic sensor Y-axis output register. The value is expressed as 16-bit word in two's complement. OUT_Y_L_M
0x2B	OUT_Y_H_M	Output	Read	represents the bottom 8 bits [7:0] of the half word and OUT_Y_H_M represent the top 8 bits [15:8] of the half-word.
0x2C	OUT_Z_L_M	Output	Read	Magnetic sensor Z-axis output register. The value is expressed as 16-bit word in two's complement. OUT_Z_L_M
0x2D	OUT_Z_H_M	Output	Read	represents the bottom 8 bits [7:0] of the half word and OUT_Z_H_M represent the top 8 bits [15:8] of the half-word.

# I2C Controller Modules (I2C0 and I2C1) [1]

# Description

Real Digital's Blackboard uses I2C1 Module through MIO pins (20 and 21) that is connected to the on-board Temperature Sensor (LM75BDP by NXP). You can find more information about the registers within <u>NXP</u> <u>Temperature Sensor</u> section. I2C0 is not used by default on the blackboard.hdf file and isn't connected to any peripherals on Blackboard.

## **Overview of Registers**

Base Address + Offset	Register Name	Reset Value	Access Type	Description
(hex)		(hex)		
I2C0: $0xE0004000 + 0x00$	<u>I2C_CTRL</u>	0x00000	Read/Write	I2C Control register
I2C1: $0xE0005000 + 0x00$				
I2C0: $0xE0004000 + 0x04$	<u>I2C_Status</u>	0x00004	Read	Status register
I2C1: $0xE0005000 + 0x04$				
I2C0: $0xE0004000 + 0x08$	<u>I2C_ADDR</u>	0x00000	Read/Write	I2C Address register
I2C1: $0xE0005000 + 0x08$				
I2C0: $0xE0004000 + 0x0C$	<u>I2C_DATA</u>	0x00000	Read/Write	I2C Data register
I2C1: $0xE0005000 + 0x0C$

# Registers

Name	Bit Range	Type	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
DIV_A	15:14	R/W	0x1	Divisor for stage A clock divider.
				Bits = $0 - 3$ : Divides the input pclk frequency by
				divisor_a + 1.
DIV_B	13:8	W	0x0	Divisor for stage B clock divider.
				Bits = $0 - 63$ : Divides the output frequency from
				divisor_a by divisor_b + 1.
Undefined	7:7	R/W	0x0	Bits 7:7 have no effect.
Clear FIFO	6:6	R/W	0x0	Bit = 0: No Effect
				Bit = 1: initializes the FIFO to all zeros and clears the
				transfer size register except in master receive mode.
				Automatically gets cleared on the next APB clock after
				being set.
Slave Monitor	5:5	R/W	0x0	Bit $= 0$ : normal operation.
Mode				Bit = 1: monitor mode.
Hold Bus	4:4	R/W	0x0	Bit $= 0$ : allow the transfer to terminate as soon as all the
				data has been transmitted or received.
				Bit = 1: when no more data is available for transmit or $\mathbf{B}$
				no more data can be received, hold the sclk line low
				until serviced by the host.
ACKEN	3:3	R/W	0x0	Bit = 0: acknowledge disabled, NACK transmitted.
				Bit = 1: acknowledge enabled, ACK transmitted.
Addressing Mode	2:2	R/W	0x0	Bit = $0$ : reserved
				Bit = 1: normal (7-bit) address
Overall Interface	1:1	R/W	0x0	Bit = 0: slave
Mode				Bit = 1: master
Direction of	0:0	R/W	0x0	Bit = 0: master transmitter.
Transfer				Bit = 1: master receiver

# <u>I2C\_IDR (I2C0: 0xE0004000 + 0x28; I2C1: 0xE0005000 + 0x28) (I2C)</u>

# **LED Module**

# Description

Blackboard has 4 individual LED's that can be configured to function in two different modes: default mode (DM) and PWM mode (PM). In PWM mode, users have control over both PWM window frequency and duty cycle. This section introduces all registers within the LED IP and how to use these in C coding.

# **Overview of Registers**

Base Address +	Register Name	Reset Value	Access Type	Description
Offset (hex)		(hex)		
0x4BB00000 + 0x00	LED_CTRL	0x0	Read/Write	Enable LEDs. Select between custom and default mode.
0x4BB00000 + 0x04	LED DFLT	0x0	Read/Write	Turn on/off LEDs if LEDs are enabled and mode bit $= 0$ .
0x4BB00000 + 0x08	LED_CNT_FRQ	0x0	Read/Write	Define PWM counter clock frequency if mode bit = 1 and clock enable bit = $0$
0x4BB00000 + 0x0C	LED_1_PWM_DC	0x0	Read/Write	Define the PWM duty cycle for LED 1. Duty Cycle should be less than the period.
0x4BB00000 + 0x10	LED_2_PWM_DC	0x0	Read/Write	Define the PWM duty cycle for LED 2. Duty Cycle should be less than the period.
0x4BB00000 + 0x14	LED_3_PWM_DC	0x0	Read/Write	Define the PWM duty cycle for LED 3. Duty Cycle should be less than the period.
0x4BB00000 + 0x18	LED_4_PWM_DC	0x0	Read/Write	Define the PWM duty cycle for LED 4. Duty Cycle should be less than the period.
0x4BB00000 + 0x1C	LED_1_PWM_PR	0x0	Read/Write	Define the PWM period value for LED 1.
0x4BB00000 + 0x20	LED_2_PWM_PR	0x0	Read/Write	Define the PWM period value for LED 2.
0x4BB00000 + 0x24	LED_3_PWM_PR	0x0	Read/Write	Define the PWM period value for LED 3.
0x4BB00000 + 0x28	LED 4 PWM PR	0x0	Read/Write	Define the PWM period value for LED 4.

# Registers

### LED\_CTRL (0x4BB00000 + 0x00) (LED)

Name	Bit Range	Туре	Reset	Description
Undefined	31:5	N/A	N/A	Bits 31:5 have no effect.
LED mode	4:4	R/W	0x0	This bit is used to determine whether the LEDs operate in default mode (bit=0), or PWM mode (bit=1). This bit also enables or disables the counter clock, Bit=0 means counter clock is disabled and bit=1 means counter clock is enabled.
LED enable	3:0	R/W	0x0	These bits are used to enable the four LEDs. Writing a 1 to any of these bits will enable the corresponding LED.

# <u>LED\_DFLT (0x4BB00000 + 0x04) (LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:4	N/A	N/A	Bits 31:4 have no effect.
LED control if operating in default mode	3:0	R/W	0x0	Writing a 1 to a specific bit in this register will turn on the corresponding LED if the LED has been enabled in the LED_CTRL register.

## <u>LED\_CNT\_FRQ (0x4BB00000 + 0x08) (LED)</u>

Name	Bit Range	Туре	Reset	Description			
PWM counter	31:0	R/W	0x0	If PWM mode and Counter Clock have been enabled,			
frequency				these bits are used to define clock dividers division			
				value X using the following equation:			
				$X = \frac{100MHZ}{2*(desired Frequency)}$ . Where X must be an integer			
				value and desi frequency is in Hz. By default, X value is			
				12, which corresponds to 4.167MHz as counter clock			
				frequency.			

#### LED\_1\_PWM\_DC (0x4BB00000 + 0x0C) (LED)

Name	Bit Range	Type	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
LED 1 PWM	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
Duty Cycle				value for LED 1.

### LED\_2\_PWM\_DC (0x4BB00000 + 0x10) (LED)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
LED 2 PWM	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
Duty Cycle				value for LED 2.

## LED\_3\_PWM\_DC (0x4BB00000 + 0x14) (LED)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
LED 3 PWM	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
Duty Cycle				value for LED 3.

#### <u>LED\_4\_PWM\_DC (0x4BB00000 + 0x18) (LED)</u>

Name	Bit Range	Type	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
LED 4 PWM	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
Duty Cycle				value for LED 4.

#### LED\_1\_PWM\_PR (0x4BB00000 + 0x1C) (LED)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
LED 1 PWM	15:0	R/W	0x0	These bits are used to choose the PWM period value for
Period				LED 1.

#### LED\_2\_PWM\_PR (0x4BB00000 + 0x20) (LED)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
LED 2 PWM	15:0	R/W	0x0	These bits are used to choose the PWM period value for
Period				LED 2.

#### LED\_3\_PWM\_PR (0x4BB00000 + 0x24) (LED)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
LED 3 PWM	15:0	R/W	0x0	These bits are used to choose the PWM period value for
Period				LED 3.

# LED\_4\_PWM\_PR (0x4BB00000 + 0x28) (LED)

Name	Bit Range	Туре	Reset	Description			
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.			
LED 4 PWM	15:0	R/W	0x0	These bits are used to choose the PWM period value for			
Period				LED 4.			

#### **Programming Examples in C**

```
Default Mode (LED)
#include <stdio.h>
#define LED_BASEADDR 0x4BB00000 // Base address of your LED IP
int main() {
    volatile int i = 0;
    *((uint32_t *) LED_BASEADDR) = 0x0F; //Mode = Default, Counter Clock disabled,
                                                            //all LEDs enabled
    *((uint32_t *) LED_BASEADDR+0x01) = 0xA; // Set LED 3 and LED 1 to 1(HIGH)
    for (i = 0; i < 20000000; i++); // Delay.</pre>
    *((uint32_t *) LED_BASEADDR+0x01) = 0x0; // Set LEDs back to 0
    return 1;
}
PWM Mode (LED)
#include <stdio.h>
// Base address of your _LED IP
#define LED BASEADDR 0x4BB00000
int main() {
    /*
    * Enable all LEDs, set LEDs to normal mode and disable counter clock before
    * defining counter clock frequency
    */
    *((uint32 t *) LED BASEADDR) = 0x0F;
    *((uint32_t *) LED_BASEADDR+0x02) = 12; // Set counter clock frequency to 4.166MHz
    /* Enable PWM MODE and counter clock after clock has been configured */
    *((uint32 t *) LED BASEADDR) = 0x01F;
    *((uint32_t *) LED_BASEADDR+0x03) = 50; // Define the PWM duty cycle for LED 0
    *((uint32_t *) LED_BASEADDR+0x04) = 200; // Define the PWM duty cycle for LED 1
    *((uint32 t *) LED BASEADDR+0x05) = 500; // Define the PWM duty cycle for LED 2
    *((uint32 t *) LED BASEADDR+0x06) = 700; // Define the PWM duty cycle for LED 3
    *((uint32_t *) LED_BASEADDR+0x07) = 1000; // Define the PWM period for LED 0
    *((uint32 t *) LED BASEADDR+0x08) = 1000; // Define the PWM period for LED 1
    *((uint32_t *) LED_BASEADDR+0x09) = 1000; // Define the PWM period for LED 2
    *((uint32 t *) LED BASEADDR+0x0a) = 1000; // Define the PWM period for LED 3
    return 1;
```

}

# LM75BDP NXP Temperature Sensor [4]

# Description

Real Digital's Blackboard has a temperature sensor, LM75BDP, provided by NXP semiconductors that can be accessed using <u>I2C1</u> interface on the Zynq chip. The 7-bit address for this chip is 1001000.

# **Overview of Registers [4]**

Register Address	Register Name	Reset Value	Access	Description
or Pointer Value		(hex)	Туре	
0x00	Temperature Value	0x00	Read	Contains two 8-bit data bytes; to store the measured temp data.
0x01	Configuration	Output	Read/Write	Configuration register: contains a single 8-bit data byte; to set the device operating condition; $default = 0$
0x02	Hysteresis Register	0x4B00	Read/Write	Hysteresis register: contains two 8-bit data bytes; to store the hysteresis $T_{hys}$ limit; default = 75 °C.
0x03	Threshold Register	0x5000	Read/Write	Overtemperature shutdown threshold register: contains two 8-bit data bytes; to store the overtemperature shutdown $T_{th(ots)}$ limit; default = 80 °C.

## **Reading Temperature Data [4]**

#### Temperature Register

The temperature register contains two 8-bit data bytes that consists of MSByte (Most Significant Byte) and LSByte (Least Significant Byte). Figure below shows the register overview. There is a total of 11 bits of actual data. D10 - D3 is considered the integer value of temperature data, where D10 is the sign bit (D10 = 0 means positive, D10 = 1 means negative). D2-D0 are the decimal point precision of the temperature value. For example,

- 011 1111 0111 (1015 in decimal) would equal to +126.875C that can be calculated with the following equation: *Temperature* = +*Temp Data* \* 0.125 °C *or* 

 $Temperature = 1015 * 0.125^{\circ}C = 126.875^{\circ}C$ 

- 110 0100 1001 (-439 in decimal) would equal to =54.875C that can be calculated with the following equation:  $Temperature = -(Two's \ Complement \ of \ Temp \ Data) * 0.125 \ ^{\circ}C \ or$ 

*Temperature* = -439 \* 0.125°C = -54.875°C

		-	-												
MSBy	/te	LSByte													
7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	х	х	х	х	х

Figure 12. Temperature Register (MSB and LSB) [4]

#### Read Temperature I2C Timing Diagram

At power-up, the pointer value is equal to 00 and the temperature register is selected. This means that users can start reading data right away from the Temperature Value register, see figure 13. If the user wants to access other registers a write transaction of the pointer value (register address) must be followed the address bits as the next byte, see figures 14 and 15 for read and write transaction with the pointer byte (register address).

Figure 13. Read Temperature Value register with preset pointer (2-byte data) [4]

Figure 14. Write Configuration Register (1-Byte Data) [4]

Figure 15. Read configuration register including pointer byte (1-Byte Data) [4]

# MIO Pin Control [1]

### Description

To initialize the MIO Buttons (BTN4 and BTN5) and MIO RGB LED (LD8), it is important to understand how you can find the corresponding pins that need to be configured. You can find the RGB LED and buttons 4 and 5 from Blackboard's open source board schematics under bank 501, see the figure below. Bank 0 corresponds to MIO pins 31:0 and Bank 1 corresponds to MIO pins 53:32 or 21:0 within the configuration registers. As you can see from the figure, MIO pins 50 and 51 correspond to buttons 4 and 5, respectively; MIO pins 16-18 correspond to the RGB LED colors. All need to be enabled as inputs and correspond to banks 1 and 0.

Figure 16. Bank 501; Blackboard's Circuit Schematic

Configuration for MIO pins to GPIO input and output pins is similar and can be done as follows:

- 1. Select MIO pin as GPIO by setting all bits in Level 0-3 mux selects to 0
- 2. Disable tristate by setting the tristate enable bit to 0. (if tristate is not disable the GPIO output enable won't have any effect)
- 3. Choose IO buffer type as LVCMOS33.
- 4. Select slow CMOS edge as the speed
- 5. Enable internal pull-up resistor for output pins and disable it for input pins
- 6. Disable HSTL receiver

### **Overview of Registers**

Base Address + Offset	Register Name	Reset Value	Access Type	Description
(hex)		(hex)		
0xF8000700 + 0x40	MIO_PIN_16	0x1601	Read/Write	MIO Pin 16 control
0xF8000700 + 0x44	MIO_PIN_17	0x1601	Read/Write	MIO Pin 17 control
0xF8000700 + 0x48	<u>MIO_PIN_18</u>	0x1601	Read/Write	MIO Pin 18 control
0xF8000700 + 0xC8	MIO_PIN_50	0x1601	Read/Write	MIO Pin 50 control
0xF8000700 + 0xCC	MIO_PIN_51	0x1601	Read/Write	MIO Pin 51 control

# Registers

Configuring MIO pins as GPIO signals can be accomplished using MIO\_PIN\_XX registers (Zynq-7000 AP SoC Technical Reference Manual page 1633-1685), all of which are identical and work for individual pins. The description of these registers can be found below:

Name	Bit Range	Туре	Reset	Description
Undefined	31:14	N/A	N/A	Bits 31:14 have no effect.
Disable Receiver	13:13	R/W	0x0	Disable HSTL Input Buffer to save power when it is an output-only (IO_Type must be HSTL). 0: enable
Pullup	12:12	R/W	0x1	Enables Pullup on IO Buffer pin 0: disable 1: enable
IO_Type	11:9	R/W	0x3	Select the IO Buffer Type. 000: Reserved 001: LVCMOS18 010: LVCMOS25 011: LVCMOS33 100: HSTL 101: Reserved 110: Reserved 111: Reserved
Speed	8:8	R/W	0x0	Select IO Buffer Edge Rate, applicable when IO_Type is LVCMOS18, LVCMOS25 or LVCMOS33. 0: Slow CMOS edge 1: Fast CMOS edge
L3_Select	7:5	R/W	0x0	Level 3 Mux Select 000: GPIO 0 (bank 0), Input/Output others: reserved
L2_Select	4:3	R/W	0x0	Level 2 Mux Select 00: Level 3 Mux 01: SRAM/NOR Chip Select 0, Output 10: NAND Flash Chip Select, Output 11: SDIO 0 Power Control, Output
L1_Select	2:2	R/W	0x0	Level 1 Mux Select 0: Level 2 Mux 1: reserved
L0_Select	1:1	R/W	0x0	Level 0 Mux Select 0: Level 1 Mux 1: Quad SPI 1 chip select, Output
Tristate Enable	0:0	R/W	0x1	Tri-state enable, active high. 0: disable 1: enable

MIO PIN	XX (	(0xF8000700 - 0xF80007D4)	) (	(MIO)	)
<u></u>	1 11 1		/ \		,

60

# **Programming Example in C**

```
void Initialize_IO(){
    *((uint32_t *) 0xF800000+0x8/4) = 0x0000DF0D; // Write unlock code to enable writing
    //into System Level Control Unlock Register
    *((uint32_t*) MIO_PIN_50) = 0x00000600; // BTN4
    *((uint32_t*) MIO_PIN_51) = 0x0000600; // BTN5
    *((uint32_t*) MIO_PIN_16) = 0x00001600; // RGB_LED_B
    *((uint32_t*) MIO_PIN_17) = 0x00001600; // RGB_LED_R
    *((uint32_t*) MIO_PIN_18) = 0x00001600; // RGB_LED_G
    return;
}
```

# **RGB LED Module**

# Description

Blackboard has 4 RGB LED's that can be configured to function in two different modes: default mode (DM) and PWM mode (PM). In PWM mode, users have control over both PWM window frequency and duty cycle. This section introduces all registers within the RGB LED IP and how to use these in C coding.

# **Overview of Registers**

Base Address +	Register Name	Reset Value	Access Type	Description
Offset (hex)		(hex)		
0x4BB01000 + 0x00	RGB_LED_CTRL	0x0	Read/Write	Enable LEDs. Select between PWM and default mode
0x4BB01000 + 0x04	RGB_LED_0_COLOR	0x0	Read/Write	Turn on RGB LED 0 with a specific color if LEDs are enabled and mode bit = 0 or 1.
0x4BB01000 + 0x08	RGB_LED_1_COLOR	0x0	Read/Write	Turn on RGB LED 1 with a specific color if LEDs are enabled and mode bit = $0$ or $1$ .
0x4BB01000 + 0x0C	RGB_LED_2_COLOR	0x0	Read/Write	Turn on RGB LED 2 with a specific color if LEDs are enabled and mode bit = $0$ or $1$ .
0x4BB01000 + 0x10	RGB_LED_3_COLOR	0x0	Read/Write	Turn on RGB LED 3 with a specific color if LEDs are enabled and mode bit = $0$ or $1$ .
0x4BB01000 + 0x14	RGB LED 0 RED DC	0x0	Read/Write	Define the PWM duty cycle for RGB LED 0 RED color. Duty Cycle should be less than the period.
0x4BB01000 + 0x18	RGB LED 0 GRN DC	0x0	Read/Write	Define the PWM duty cycle for RGB LED 0 GREEN color. Duty Cycle should be less than the period.
0x4BB01000 + 0x1C	<u>RGB_LED_0_BLU_DC</u>	0x0	Read/Write	Define the PWM duty cycle for RGB LED 0 BLUE color. Duty Cycle should be less than the period.

0x4BB01000 + 0x20	RGB_LED_1_RED_DC	0x0	Read/Write	Define the PWM duty cycle for RGB LED 1
				should be less than the period.
0x4BB01000 + 0x24	RGB_LED_1_GRN_DC	0x0	Read/Write	Define the PWM duty cycle for RGB LED 1 GREEN color. Duty Cycle should be less than the period.
0x4BB01000 + 0x28	RGB_LED_1_BLU_DC	0x0	Read/Write	Define the PWM duty cycle for RGB LED 1 BLUE color. Duty Cycle should be less than the period.
0x4BB01000 + 0x2C	<u>RGB_LED_2_RED_DC</u>	0x0	Read/Write	Define the PWM duty cycle for RGB LED 2 RED color. Duty Cycle should be less than the period.
0x4BB01000 + 0x30	<u>RGB_LED_2_GRN_DC</u>	0x0	Read/Write	Define the PWM duty cycle for RGB LED 2 GREEN color. Duty Cycle should be less than the period.
0x4BB01000 + 0x34	<u>RGB_LED_2_BLU_DC</u>	0x0	Read/Write	Define the PWM duty cycle for RGB LED 2 BLUE color. Duty Cycle should be less than the period.
0x4BB01000 + 0x38	<u>RGB_LED_3_RED_DC</u>	0x0	Read/Write	Define the PWM duty cycle for RGB LED 3 RED color. Duty Cycle should be less than the period.
0x4BB01000 + 0x3C	RGB_LED_3_GRN_DC	0x0	Read/Write	Define the PWM duty cycle for RGB LED 3 GREEN color. Duty Cycle should be less than the period.
0x4BB01000 + 0x40	RGB_LED_3_BLU_DC	0x0	Read/Write	Define the PWM duty cycle for RGB LED 3 BLUE color. Duty Cycle should be less than the period.
0x4BB01000 + 0x44	RGB_LED_0_RED_PR	0x0	Read/Write	Define the PWM period value for RGB LED 0 RED color.
0x4BB01000 + 0x48	<u>RGB_LED_0_GRN_PR</u>	0x0	Read/Write	Define the PWM period value for RGB LED 0 GREEN color.

0x4BB01000 + 0x4C	RGB_LED_0_BLU_PR	0x0	Read/Write	Define the PWM period value for RGB LED 0 BLUE color.
0x4BB01000 + 0x50	RGB_LED_1_RED_PR	0x0	Read/Write	Define the PWM period value for RGB LED 1 RED color.
0x4BB01000 + 0x54	<u>RGB_LED_1_GRN_PR</u>	0x0	Read/Write	Define the PWM period value for RGB LED 1 GREEN color.
0x4BB01000 + 0x58	<u>RGB_LED_1_BLU_PR</u>	0x0	Read/Write	Define the PWM period value for RGB LED 1 BLUE color.
0x4BB01000 + 0x5C	RGB_LED_2_RED_PR	0x0	Read/Write	Define the PWM period value for RGB LED 2 RED color.
0x4BB01000 + 0x60	RGB LED 2 GRN PR	0x0	Read/Write	Define the PWM period value for RGB LED 2 GREEN color.
0x4BB01000 + 0x64	RGB_LED_2_BLU_PR	0x0	Read/Write	Define the PWM period value for RGB LED 2 BLUE color.
0x4BB01000 + 0x68	RGB_LED_3_RED_PR	0x0	Read/Write	Define the PWM period value for RGB LED 3 RED color.
0x4BB01000 + 0x6C	RGB_LED_3_GRN_PR	0x0	Read/Write	Define the PWM period value for RGB LED 3 GREEN color.
0x4BB01000 + 0x70	RGB LED 3 BLU PR	0x0	Read/Write	Define the PWM period value for RGB LED 3 BLUE color.

# Registers

### <u>RGB\_LED\_CTRL</u> (0x4BB01000 + 0x00) (<u>RGB\_LED</u>)

Name	Bit Range	Туре	Reset	Description
Undefined	31:5	N/A	N/A	Bits 31:5 have no effect.
RGB LED mode	4:4	R/W	0x0	This bit is used to determine whether the RGB LEDs operate in default mode (bit=0), or PWM mode (bit=1).
RGB LED enable	3:0	R/W	0x0	These bits are used to enable the four RGB LEDs. Writing a 1 to any of these bits will enable the corresponding RGB LED.

#### <u>RGB\_LED\_0\_COLOR (0x4BB01000 + 0x04) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:3	N/A	N/A	Bits 31:3 have no effect.
RGB LED 0 Color	2:0	R/W	0x0	Writing a 3-bit value in this register will turn on
Control				RGB_LED 0 in the specified color combination if the
				LED has been enabled in the RGB_LED_CTRL
				register. This register works even if PWM mode is
				enabled.

# <u>RGB\_LED\_1\_COLOR (0x4BB01000 + 0x08) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:3	N/A	N/A	Bits 31:3 have no effect.
RGB LED 1 Color Control	2:0	R/W	0x0	Writing a 3-bit value in this register will turn on RGB_LED 1 in the specified color combination if the LED has been enabled in the RGB_LED_CTRL register. This register works even if PWM mode is enabled.

# <u>RGB\_LED\_2\_COLOR (0x4BB01000 + 0x0C) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:3	N/A	N/A	Bits 31:3 have no effect.
RGB LED 2 Color Control	2:0	R/W	0x0	Writing a 3-bit value in this register will turn on RGB_LED 2 in the specified color combination if the LED has been enabled in the RGB_LED_CTRL register. This register works even if PWM mode is enabled.

### <u>RGB\_LED\_3\_COLOR (0x4BB01000 + 0x10) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:3	N/A	N/A	Bits 31:3 have no effect.
RGB LED 3 Color	2:0	R/W	0x0	Writing a 3-bit value in this register will turn on
Control				RGB_LED 3 in the specified color combination if the
				LED has been enabled in the RGB_LED_CTRL
				register. This register works even if PWM mode is
				enabled.

## <u>RGB\_LED\_0\_RED\_DC (0x4BB01000 + 0x14) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 0 RED	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 0 RED Color.

#### <u>RGB\_LED\_0\_GRN\_DC (0x4BB01000 + 0x18) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 0 GRN	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 0 GREEN Color.

#### <u>RGB\_LED\_0\_BLU\_DC (0x4BB01000 + 0x1C) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 0 BLU	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 0 BLUE Color.

#### <u>RGB\_LED\_1\_RED\_DC</u> (0x4BB01000 + 0x20) (<u>RGB\_LED</u>)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 1 RED	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 1 RED Color.

#### <u>RGB\_LED\_1\_GRN\_DC (0x4BB01000 + 0x24) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 1 GRN	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 1 GREEN Color.

#### <u>RGB\_LED\_1\_BLU\_DC (0x4BB01000 + 0x28) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 1 BLU	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 1 BLUE Color.

#### <u>RGB\_LED\_2\_RED\_DC (0x4BB01000 + 0x2C) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 2 RED	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 2 RED Color.

#### <u>RGB\_LED\_2\_GRN\_DC (0x4BB01000 + 0x30) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 2 GRN	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 2 GREEN Color.

## <u>RGB\_LED\_2\_BLU\_DC (0x4BB01000 + 0x34) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 2 BLU	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 2 BLUE Color.

#### <u>RGB\_LED\_3\_RED\_DC (0x4BB01000 + 0x38) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 3 RED PWM Duty Cycle	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle value for RGB LED 3 RED Color.

#### <u>RGB\_LED\_3\_GRN\_DC</u> (0x4BB01000 + 0x3C) (<u>RGB\_LED</u>)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 3 GRN	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 3 GREEN Color.

#### <u>RGB\_LED\_3\_BLU\_DC</u> (0x4BB01000 + 0x40) (<u>RGB\_LED</u>)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 3 BLU	15:0	R/W	0x0	These bits are used to choose the PWM Duty Cycle
PWM Duty Cycle				value for RGB LED 3 BLUE Color.

#### <u>RGB\_LED\_0\_RED\_PR (0x4BB01000 + 0x44) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 0 RED PWM Period	15:0	R/W	0x0	These bits are used to choose the PWM period value for RGB LED 0 RED Color.

#### <u>RGB\_LED\_0\_GRN\_PR (0x4BB01000 + 0x48) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 0 GRN	15:0	R/W	0x0	These bits are used to choose the PWM period value for
PWM Period				RGB LED 0 GREEN Color.

#### <u>RGB\_LED\_0\_BLU\_PR (0x4BB01000 + 0x4C) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 0 BLU	15:0	R/W	0x0	These bits are used to choose the PWM period value for
PWM Period				RGB LED 1 BLUE Color.

#### <u>RGB\_LED\_1\_RED\_PR (0x4BB01000 + 0x50) (RGB\_LED)</u>

Name	Bit Range	Type	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 1 RED	15:0	R/W	0x0	These bits are used to choose the PWM period value for
PWM Period				RGB LED 1 RED Color.

## <u>RGB\_LED\_1\_GRN\_PR (0x4BB01000 + 0x54) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 1 GRN	15:0	R/W	0x0	These bits are used to choose the PWM period value for
PWM Period				RGB LED 1 GREEN Color.

#### <u>RGB\_LED\_1\_BLU\_PR</u> (0x4BB01000 + 0x58) (<u>RGB\_LED</u>)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 1 BLU	15:0	R/W	0x0	These bits are used to choose the PWM period value for
PWM Period				RGB LED 1 BLUE Color.

## <u>RGB\_LED\_2\_RED\_PR (0x4BB01000 + 0x5C) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 2 RED PWM Period	15:0	R/W	0x0	These bits are used to choose the PWM period value for RGB LED 2 RED Color.

#### <u>RGB\_LED\_2\_GRN\_PR (0x4BB01000 + 0x60) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 2 GRN	15:0	R/W	0x0	These bits are used to choose the PWM period value for

Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 3 GRN	15:0	R/W	0x0	These bits are used to choose the PWM period value for
PWM Period				RGB LED 3 GREEN Color.

#### <u>RGB\_LED\_3\_BLU\_PR (0x4BB01000 + 0x70) (RGB\_LED)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
RGB LED 3 BLU	15:0	R/W	0x0	These bits are used to choose the PWM period value for
PWM Period				RGB LED 3 BLUE Color.

#### **Programming Examples in C**

Default Mode (RGB\_LED)

```
#include <stdio.h>
// Base address of your RGB_LED IP
#define RGB LED BASEADDR 0x4BB01000
int main() {
    /* Enable all LEDs, set LEDs to default mode */
    *((uint32_t *) RGB_LED_BASEADDR) = 0x0F;
    *((uint32_t *) RGB_LED_BASEADDR+0x01) = 1; // Set RGB_LED_1 color to red
    *((uint32_t *) RGB_LED_BASEADDR+0x02) = 2; // Set RGB_LED_2 color to green
    *((uint32_t *) RGB_LED_BASEADDR+0x03) = 4; // Set RGB_LED_3 color to blue
    *((uint32 t *) RGB LED BASEADDR+0x04) = 7; // Set RGB LED 4 color to white
    return 1;
}
PWM Mode (RGB_LED)
#include <stdio.h>
// Base address of your RGB LED IP
#define RGB_LED_BASEADDR 0x4BB01000
int main() {
    /* Enable all LEDs, set LEDs to PWM mode */
      *((uint32_t *) RGB_LED_BASEADDR) = 0x1F;
    //Define PWM duty cycle for RGB LED 3 Color RED
    *((uint32_t *) RGB_LED_BASEADDR+0x0b) = 10;
    //Define PWM duty cycle for RGB LED 3 Color Green
    *((uint32_t *) RGB_LED_BASEADDR+0x0c) = 30;
    // Define PWM duty cycle for RGB LED 3 Color Blue
    *((uint32_t *) RGB_LED_BASEADDR+0x0d) = 60;
    *((uint32 t *) RGB LED BASEADDR+23) = 100; //Define PWM period for RGB LED 3 Color RED
    *((uint32_t *) RGB_LED_BASEADDR+24) = 100; //Define PWM period for RGB LED 3 Color Green
    *((uint32_t *) RGB_LED_BASEADDR+25) = 100; //Define PWM period for RGB LED 3 Color Blue
   return 1;
```

}

# Seven Segment Display Module

## Description

Blackboard has a 4-digit common anode seven-segment display module. As shown in figure below, the first digit of the seven-segment display corresponds to AN1 location and the fourth digit corresponds to AN4 location.

Figure 17. Seven-segment display diagram

This Seven Segment Display IP (SEVEN\_SEG\_DISP) has two modes: default mode (DM) and custom mode (CM). When operating in default mode, each digit on the 7-segement display can display one hex digit (0-9 and A-F). When operating in custom mode, the user can choose which cathodes are enabled for each digit. As shown in figure 2, bit 0 would correspond to cathode "A," and bit 6 to cathode "G" in SEVEN\_SEG\_DIGIT registers.

# **Overview of Registers**

Base Address +	Register Name	Reset Value	Access	Description
Offset (hex)		(hex)	Туре	
0X4BB03000 + 0x00	SVN_SEG_CTRL	0x0	Read/Write	Enable seven-segment display. Select between custom and default mode.
0X4BB03000 + 0x04	<u>SVN_SEG_DIGIT_1</u>	0x0	Read/Write	Write a value to the first seven segment display digit.
0X4BB03000 + 0x08	<u>SVN_SEG_DIGIT_2</u>	0x0	Read/Write	Write a value to the second seven segment display digit.
0X4BB03000+ 0x0C	<u>SVN_SEG_DIGIT_3</u>	0x0	Read/Write	Write a value to the third seven segment display digit.
0X4BB03000 + 0x10	SVN_SEG_DIGIT_4	0x0	Read/Write	Write a value to the fourth seven segment display digit.
0X4BB03000 + 0x14	SVN_SEG_DP	0x0	Read/Write	Define which decimal points are turned on.

# Registers

# <u>SVN\_SEG\_CTRL</u> (0x4BB03000 + 0x00) (<u>SSD</u>)

Name	Bit Range	Туре	Reset	Description
Undefined	31:5	N/A	N/A	Bits 31:5 have no effect.
Seven Segment Display Mode	4:4	R/W	0x0	This bit is used to determine whether the seven-segment display operates in default mode (bit = 0), or custom mode (bit = 1).
Undefined	3:1	N/A	N/A	Bits 3:1 have no effect.
Seven Segment Display Enable	0:0	R/W	0x0	This bit is used to enable the seven-segment display. Writing a 1 to this bit enables the display.

# <u>SVN\_SEG\_DIGIT\_1 (0x4BB03000 + 0x04) (SSD</u>)

Name	Bit Range	Туре	Reset	Description
Undefined	31:4(DM)	N/A	N/A	Bits 31:4 have no effect if default mode (DM) is
	51:7(CM)			is enabled
				is chubica.
Seven Segment	3:0 (DM)	R/W	0x0	These bits are used choose what is being displayed on
Display Digit 1	6:0 (CM)			the first digit based on which mode has been selected.
Control				

# <u>SVN\_SEG\_DIGIT\_2 (0x4BB03000 + 0x08) (SSD)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:4(DM)	N/A	N/A	Bits 31:4 have no effect if default mode (DM) is
	31:7(CM)			enabled. Bits 31:7 have no effect if custom mode (CM)
				is enabled.
Seven Segment	3:0 (DM)	R/W	0x0	These bits are used choose what is being displayed on
Display Digit 2	6:0 (CM)			the second digit based on which mode has been selected.
Control				

## <u>SVN\_SEG\_DIGIT\_3 (0x4BB03000 + 0x0C) (SSD)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:4(DM)	N/A	N/A	Bits 31:4 have no effect if default mode (DM) is
	31:7(CM)			enabled. Bits 31:7 have no effect if custom mode (CM)
				is enabled.
Seven Segment	3:0 (DM)	R/W	0x0	These bits are used choose what is being displayed on
Display Digit 3	6:0 (CM)			the third digit based on which mode has been selected.
Control				

#### <u>SVN\_SEG\_DIGIT\_4 (0x4BB03000 + 0x10) (SSD)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:4(DM)	N/A	N/A	Bits 31:4 have no effect if default mode (DM) is
	31:7(CM)			enabled. Bits 31:7 have no effect if custom mode (CM)
				is enabled.
Seven Segment	3:0 (DM)	R/W	0x0	These bits are used choose what is being displayed on
Display Digit 4	6:0 (CM)			the fourth digit based on which mode has been selected.
Control				

### <u>SVN\_SEG\_DP (0x4BB03000 + 0x14) (SSD)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:4	N/A	N/A	Bits 31:4 have no effect.
Seven Segment Display Decimal Point Control	3:0	R/W	0x0	These bits are used to enable decimal points. Bit 0 corresponds to digit 1.

#### **Programming Examples in C**

```
Default Mode (SSD)
```

```
#include <stdio.h>
#define SSEG 0x4BB03000
```

```
int main() {
    *((uint32_t *) SSEG+0x00) = 0x01; //Default mode, enable 7-seg disp
    *((uint32_t *) SSEG+0x01) = 0x0F; //Write F to digit 1
    *((uint32_t *) SSEG+0x02) = 0x05; //Write 5 to digit 2
    *((uint32_t *) SSEG+0x03) = 0x0d; //Write d to digit 3
    *((uint32_t *) SSEG+0x04) = 0x0F; //Write F to digit 4
    *((uint32 t *) SSEG+0x05) = 0x0; // disable all decimal points
}
```

```
Custom Mode (SSD)
```

```
#include <stdio.h>
#define SSEG 0x4BB03000
```

```
int main() {
    *((uint32_t *) SSEG+0x00) = 0x11; //Custom mode, enable 7-seg disp
    *((uint32_t *) SSEG+0x01) = 0x4E; //Write 0x4E to digit 1, to display r
    *((uint32_t *) SSEG+0x02) = 0x21; //Write 0x21 to digit 2, to display d
    *((uint32 t *) SSEG+0x03) = 0x79; //Write 0x79 to digit 3, to display 1
    *((uint32_t *) SSEG+0x04) = 0x00; //Write 0x00 to digit 4, to display 8
    *((uint32_t *) SSEG+0x05) = 0x2; //Enable second decimal point
}
```

# SPI Controller Modules (SPI0 and SPI1) [1]

# Description

Real Digital's Blackboard uses SPI0 Module through EMIO (External MIO) pins that is connected to the on-board Navigation Sensor (LSM9DS1 by STMicroelectronics). Since the NAV sensor has three sensors within it (3D Accelerometer, 3D Gyroscope, and 3D Magnetometer) chip select (CS) line 0 is used to initiate data transfer to/from Accelerometer or Gyroscope, and CS line 1 is used to initiate data transfer to/from Magnetometer. You can find more information about the registers within iNEMO Intertial Module section.

# **Overview of Registers**

Base Address + Offset	Register Name	Reset Value	Access Type	Description
(hex)		(hex)		
		· ,		
SPI0: $0xE0006000 + 0x00$	<u>SPI_Config</u>	0x20000	Read/Write	SPI Configuration Register
SPI1: $0xE0007000 + 0x00$				
SPI0: $0xE0006000 + 0x04$	SPI INT Status	0x00004	Read/Write	SPI Interrupt Status
SPI1: 0xE0007000 + 0x04				
SPI0: 0xE0006000 + 0x08	<u>SPI_INT_EN</u>	0x00000	Read/Write	Interrupt Enable Register

				Bits = $x011$ - slave 2 selected
				Bits = 0111 - reserved
				Bits = 1111 - No slave selected
Peripheral Select	9:9	R/W	0x0	Bit = 0: only 1 of 3 selects $\mathbf{B}$
Decode				Bit = 1: allow external 3-to-8 decode
Master Reference	8:8	R/W	0x0	Bit = 0: use SPI Reference Clock
Clock Select				Bit = 1: not supported
Reserved	7:6	R/W	0x0	Reserved, read as zero, write with 00
Master Mode Baud	5:3	R/W	0x0	Master mode baud rate divisor controls the amount the
Rate				SPI reference clock is divided inside the SPI block
				Bits $= 000$ : not supported
				Bits = $001$ : divide by 4
				Bits = $010$ : divide by 8
				Bits = $011$ : divide by 16
				Bits = $100$ : divide by $32$
				Bits = $101$ : divide by 64
				Bits = $110$ : divide by $128$
				Bits = $111$ : divide by 256
Clock Phase	2:2	R/W	0x0	Bit = 0: the SPI clock is active outside the word
				Bit = 1: the SPI clock is inactive outside the word
Clock Polarity	1:1	R/W	0x0	Bit = 0: the SPI clock is quiescent low $\mathbf{B}$
				Bit = 1: the SPI clock is quiescent high
Mode Select	0:0	R/W	0x0	Bit = 0: the SPI is in slave mode $\mathbf{B}$
				Bit = 1: the SPI is in master mode

Name	Bit Range	Туре	Reset	Description
Undefined	31:7	N/A	N/A	Bits 31:7 have no effect.
Transmitter FIFO	6:6	Write to Clear	0x0	Bit = 0: no underflow has been detected
Underflow				Bit = 1: underflow is detected $\mathbf{B}$
Receiver FIFO	5:5	Write to Clear	0x0	Bit = 0: FIFO is not full
Full				Bit = 1: FIFO is full $\mathbf{B}$
Receiver FIFO	4:4	Write to Clear	0x0	Bit = 0: FIFO has less than Receiver Threshold
Not Empty				entries
				Bit = 1: FIFO has more than or equal to $\mathbf{B}$
				Threshold entries
Transmitter FIFO	3:3	Write to Clear	0x0	Bit = 0: FIFO is not full
Full				Bit = 1: FIFO is full
Transmitter FIFO	2:2	Write to Clear	0x1	Bit = 0: FIFO has more than or equal to $\frac{1}{2}$
Not Empty				Threshold entries
				Bit = 1: FIFO has less than Transmitter
				Threshold entries
ModeFail	1:1	Write to Clear	0x0	Indicates the voltage on pin n_ss_in is
Interrupt				inconsistent with the SPI mode. Set $=1$ if
				n_ss_in is low in master mode (multi-master
				contention) or n_ss_in goes high during a
				transmission in slave mode. These conditions
				will clear the spi_enable bit and disable the SPI.
				This bit is reset only by a system reset and
				cleared only when this register is read.
				Bit = 0: no mode fault has been detected
				Bit = 1: a mode fault has occurred
Receive Overflow	0:0	Write to Clear	0x0	Bit = 0: no overflow occurred
Interrupt				Bit = 1: overflow occurred

SPI Enable	0:0	R	0x0	Bit = 0: Disable the SPI Bit = 1: Enable the SPI

## <u>SPI\_Delay (SPI0: 0xE0006000 + 0x18; SPI1: 0xE0007000 + 0x18) (SPI)</u>

Name	Bit Range	Туре	Reset	Description
Delay in Master Mode CS	31:24	R/W	0x0	Delay in SPI Reference Clock or ext_clk
Between Words				cycles for the length that the master mode
				chip select outputs are de-asserted between
				words when CPHA=0.
Delay Between Chip	23:16	R/W	0x0	Delay in SPI Reference Clock or ext_clk
Selects De-Activation and				cycles between one chip select being de-
Activation				activated and the activation of another
Delay Between Last and	15:8	R/W	0x0	Delay in SPI Reference Clock or ext_clk
First Bit				cycles between last bit of current word and
				the first bit of the next word.
Added Delay Before Data	7:0	R/W	0x0	Added delay in SPI Reference Clock or
Transfer				ext_clk cycles between setting n_ss_out low
				and first bit transfer.

#### <u>SPI\_Transmit (SPI0: 0xE0006000 + 0x1C; SPI1: 0xE0007000 + 0x1C) (SPI)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:8	N/A	N/A	Bits 31:8 have no effect.
Data to Transmitter FIFO	7:0	W	0x0	Data to Transmitter FIFO. Writing into this register will initiate data transfer if SPI has been enabled. Size of the FIFO is 128 Bytes deep.

## <u>SPI\_Receive (SPI0: 0xE0006000 + 0x20; SPI1: 0xE0007000 + 0x20) (SPI)</u>

Name	Bit Range	Type	Reset	Description
Undefined	31:8	N/A	N/A	Bits 31:8 have no effect.
Data from Receiver FIFO	7:0	R	0x0	Data from receiver FIFO. Size of the FIFO is
				128 Bytes deep.

#### <u>SPI\_Slave\_IDL</u> (SPI0: 0xE0006000 + 0x24; SPI1: 0xE0007000 + 0x24) (SPI)

Name	Bit Range	Туре	Reset	Description
Undefined	31:8	N/A	N/A	Bits 31:8 have no effect.
Slave Idle Count	7:0	R/W	0xFF	SPI in slave mode detects a start only when the external SPI master serial clock (sclk_in) is stable (quiescent state) for SPI Reference Clock cycles specified by slave idle count register or when the SPI is deselected.

#### <u>SPI\_T\_Threshold (SPI0: 0xE0006000 + 0x28; SPI1: 0xE0007000 + 0x28) (SPI)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:0	N/A	N/A	Bits 31:8 have no effect.
Transmitter FIFO Threshold Level	7:0	R/W	0x1	Defines the level at which the Transmitter FIFO not full interrupt is generated

## <u>SPI\_R\_Threshold (SPI0: 0xE0006000 + 0x2C; SPI1: 0xE0007000 + 0x28) (SPI)</u>

Undefined	31:0	N/A	N/A	Bits 31:8 have no effect.
Receiver FIFO Threshold	7:0	R/W	0x1	Defines the level at which the Receiver FIFO
Level				not full interrupt is generated

## <u>SPI\_Module\_ID (SPI0: 0xE0006000 + 0xFC; SPI1: 0xE0007000 + 0xFC) (SPI)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:25	N/A	N/A	Bits 31:25 have no effect.
SPI Module ID	24:0	R	0x90106	Module ID number

# **Switches and Buttons Module**

## Description

Blackboard has 4 buttons and 8 switches that are non-MIO (Multiplexed Input Output); these can be read through registers from this module.

## **Overview of Registers**

Base Address +	Register Name	Reset Value	Access	Description
Offset (hex)		(hex)	Туре	
0x4BB02000 + 0x00	SB_SWITCHES	N/A	Read	Read switches
0x4BB02000 + 0x04	<u>SB BUTTONS</u>	N/A	Read	Read Buttons

#### Registers

#### <u>SB\_SWITCHES (0x4BB02000 + 0x00) (SB)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:8	N/A	N/A	Bits 31:8 have no effect.
Switch Values	7:0	R	0x0	Reading from this register will result in the current values of the switches.

#### <u>SB\_BUTTONS (0x4BB02000 + 0x04) (SB)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:8	N/A	N/A	Bits 31:4 have no effect.
Button Values	3:0	R	0x0	Reading from this register will result in the current values of the buttons.

## **Programming Example in C**

```
#include <stdio.h>
#define SB_BASEADDR 0x4BB02000 // Base address of your Switches and Buttons IP
int main() {
      uint32 t switches, buttons;
      switches = *((uint32_t *) SB_BASEADDR); // read values from switches
      buttons = *((uint32 t *) SB BASEADDR+0x01); // read values from buttons
      while(1) {
             switches = *((uint32_t *) SB_BASEADDR); // read values from switches
             buttons = *((uint32_t *) SB_BASEADDR+0x01); // read values from buttons
             if(switches == 0x03) {
                    printf("Switches 1 and 2 are high\n");
                    break;
             }
             else if (buttons == 0x09) {
                    printf("Buttons 1 and 4 are high\n");
                    break;
             }
      }
    return 1;
}
```

# **Triple Timer Counter Modules (TTC0 and TTC1) [1]**

# Description

Blackboard has two Triple Timer Counters (TTC) that are part of the ZYNQ PS. Each TTC has three counters that have an interrupt control system. All the TTC registers introduced within this documentation are taken from Xilinx's documentation.

# **Overview of Registers**

## <u>Clock\_Control\_1 (TTC0: 0xF8001000+0x00; TTC1: 0xF8002000+0x00) (TTC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:7	N/A	N/A	Bits 31:7 have no effect.
External Clock Edge	6:6	R/W	0x0	Bit = 1 and external clock is selected: the counter triggers on the negative edge of the external clock input.
Clock Source	5:5	R/W	0x0	Bit = 1: the counter uses external clock input, ext_clk; Bit = 0: clock source is pclk.
Prescale Value	4:1	R/W	0x0	Prescale value (N): if prescale is enabled the count rate is divided by $2^{N+1}$
Prescale Enable	0:0	R/W	0x0	Bit = 1: the clock source is prescaled. Bit = 0: prescale is disabled.

## <u>Clock\_Control\_2 (TTC0: 0xF8001000+0x04; TTC1: 0xF8002000+0x04) (TTC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:7	N/A	N/A	Bits 31:7 have no effect.
External Clock Edge	6:6	R/W	0x0	Bit = 1 and external clock is selected: the counter triggers on the negative edge of the external clock input.
Clock Source	5:5	R/W	0x0	Bit = 1: the counter uses external clock input, ext_clk; Bit = 0: clock source is pclk.
Prescale Value	4:1	R/W	0x0	Prescale value (N): if prescale is enabled the count rate is divided by $2^{N+1}$
Prescale Enable	0:0	R/W	0x0	Bit = 1: the clock source is prescaled. Bit = 0: prescale is disabled.

## Clock\_Control\_3 (TTC0: 0xF8001000+0x08; TTC1: 0xF8002000+0x08) (TTC)

Name	Bit Range	Туре	Reset	Description
Undefined	31:7	N/A	N/A	Bits 31:7 have no effect.
External Clock Edge	6:6	R/W	0x0	Bit = 1 and external clock is selected: the counter triggers on the negative edge of the external clock input.
Clock Source	5:5	R/W	0x0	Bit = 1: the counter uses external clock input, ext_clk; Bit = 0: clock source is pclk.

# System Level Control Registers (SLCR) [1]

# Description

Xilinx Zynq All Programmable SoC comes with system level control registers. There are various registers for Xilinx's Zynq SoC modules, such as clock configuration, software reset, and MIO pin configuration registers. MIO pin configuration can be found within in this reference manual under <u>MIO Pin Control</u>. This section focuses on the software reset registers for SPI and I2C modules.

# **Overview of Registers**

Base Address + Offset	Register Name	Reset Value	Access Type	Description
(hex)		(hex)

## Registers

#### SLCR\_UNLOCK (0xF8000000+0x08) (SLCR)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
UNLOCK_KEY	15:0	W	0x0	Write the unlock key, 0xDF0D, to enable writes to the slcr registers. All slcr registers, 0xF800_0000 to 0xF800_0B74, are writeable until locked using the SLCR_LOCK register. A read of this register returns zero.

#### <u>SPI\_RST\_CTRL</u> (0xF8000000+0x21C) (<u>SLCR</u>)

Name	Bit Range	Туре	Reset	Description
Undefined	31:4	N/A	N/A	Bits 31:4 have no effect.
SPI1_REF_RST	3:3	R/W	0x0	SPIx Reference software reset. On assertion of this reset, the Reference clock portion of the SPIx subsystem will be reset.
SPI0_REF_RST	2:2	R/W	0x0	Bit = 0: No Reset Bit = 1: Reference clock portion of SPIx subsystem held in reset
SPI1_CPU1X_RST	1:1	R/W	0x0	SPIx AMBA software reset. On assertion of this reset, the AMBA clock portion of the SPIx subsystem will be reset.
SPI0_CPU1X_RST	0:0	R/W	0x0	Bit = 0: No Reset Bit = 1: AMBA clock portion of SPIx subsystem held in reset

#### <u>I2C\_RST\_CTRL (0xF8000000+0x224) (SLCR)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:2	N/A	N/A	Bits 31:2 have no effect.
I2C1_CPU1X_RST	1:1	R/W	0x0	I2Cx AMBA software reset. On assertion of this reset, the AMBA clock portion of the I2Cx subsystem will be reset.
I2C0_CPU1X_RST	0:0	R/W	0x0	Bit = 0: No Reset Bit = 1: AMBA clock portion of I2Cx subsystem held in reset

## Programming Example in C (SLCR)

I2C Software Reset

# UART Controller Modules (UART0 and UART1) [1]

## Description

Xilinx Zynq All Programmable SoC comes with an UART Controller Module that consists UART0 and UART1. Both have pre-assigned connections on the Blackboard by default. UART0 is connected to MIO Pins 14 and 15 (ESP32\_TXD0 and ESP32\_RXD0, respectively) as shown in figure 6. On the other hand, UART1 is connected to MIO Pins 48 and 49 (UART\_TXD\_IN and UART\_RXD\_OUT) as shown in figure 7. The FTDI FT2232H IC automatically connects to a COM port on your computer, which will enable data transfer through UART1 to the console of Xilinx's SDK – this enables the user to send characters through UART.

UART1: 0xE0001000 + 0x30				FIFO
UART0: 0xE000000 + 0x34	UART_Baud_Div	0x000F	Read/Write	Baud Rate Divider
UART1: 0xE0001000 + 0x34				Register
UART0: 0xE0000000 + 0x38	UART_FCD	0x0	Read/Write	Flow Control Delay
UART1: 0xE0001000 + 0x38				Register
UART0: 0xE0000000 + 0x44	UART_TFIFO_LVL	0x20	Read/Write	Transmitter FIFO
UART1: 0xE0001000 + 0x44				Trigger Level Register

# Registers

HART	Control (	$(I \downarrow A P T \cap O \mathbf{v} F \cap O \cap O \cap O + O \mathbf{v})$	) $0.11$ A P T $1.0$ v F $0.01000 \pm 0.0$	2001	
UAKI	Control	UAK10. 0XE0000000 + 0X	JU, UARTI, UXEUUU1000 + 0X	(00)	(UAKI)

Name	Bit Range	Type	Reset	Description
Undefined	31:9	N/A	N/A	Bits 31:9 have no effect.
Stop Transmitter Break	8:8	R/W	0x1	Bit = 0: no affect Bit = 1: stop transmission of the break after a minimum of one-character length and transmit a high level during 12-bit periods. It can be set regardless of the value of Start Transmitter Break.
Start Transmitter Break	7:7	R/W	0x0	Bit = 0: no affect Bit = 1: start to transmit a break after the characters currently present in the FIFO and the transmit shift register have been transmitted. This bit can only be set if Stop transmitter break is not high.
UART Restart Receiver Timeout Counter	6:6	R/W	0x0	Bit = 1: receiver timeout counter is restarted. This bit will be automatically cleared once the restart has completed.
Transmit Disable	5:5	R/W	0x1	Bit = 0: enable transmitter, if Transmit Enable bit =1 Bit = 1: disable transmitter, regardless of Transmit Enable value
Transmit Enable	4:4	R/W	0x0	Bit = 0: disable transmitter Bit = 1: enable transmitter if the Transmit Disable bit is set to 0.
Receive Disable	3:3	R/W	0x1	Bit = 0: enable, if Receive Enable bit = 1 Bit = 1: disable, regardless of the value of Receive Enable
Receive Enable	2:2	R/W	0x0	Bit = 0: disable Bit = 1: enable When set to one, the receiver logic is enabled, provided the Receive Disable field is set to zero.
Software Reset Tx Data Path	1:1	R/W	0x0	Bit = 0: no affect Bit = 1: transmitter logic is reset, and all pending transmitter data is discarded. This bit will be automatically cleared once the restart has completed.
Software Reset Rx Data Path	0:0	R/W	0x0	Bit = 0: no affect Bit = 1: receiver logic is reset, and all pending receiver data is discarded. This bit will be automatically cleared once the restart has completed.

UART_Mode (UART0: 0xE0000000 + 0x04; UART1: 0xE0001000 + 0x04) (UA	RT)
--	-----

Name	Bit Range	Туре	Reset	Description
Undefined	31:12	N/A	N/A	Bits 31:12 have no effect.
Reserved	11:10	R/W	0x0	Reserved. Do not modify.
Channel Mode	9:8	R/W	0x0	Defines the mode of operation of the UART. Bits = 00: normal Bits = 01: automatic echo Bits = 10: local loopback Bits = 11: remote loopback
Number of Stop Bits	7:6	R/W	0x0	Defines the number of stop bits to detect on receive and to generate on transmit. Bits = 00: 1 stop bit Bits = 01: 1.5 stop bits Bits = 10: 2 stop bits Bits = 11: reserved
Parity Type Select	5:3	R/W	0x0	Defines the expected parity to check on receive and the parity to generate on transmit. Bits = 000: even parity Bits = 001: odd parity Bits = 010: forced to 0 parity (space) Bits = 011: forced to 1 parity (mark) Bits = 1xx: no parity
Character Length Select	2:1	R/W	0x0	Defines the number of bits in each character. Bits = 11: 6 bits Bits = 10: 7 bits Bits = 0x: 8 bits
Clock Source Select	0x0	R/W	0x0	This field defines whether a pre-scalar of 8 is applied to the baud rate generator input clock. Bit = 0: clock source is uart_ref_clk Bit = 1: clock source is uart_ref_clk/8

<u>UART_ISR (UART0: 0xE0000000 + 0x14; UART1: 0xE0001000 + 0x14) (UART</u>
--

Name	Bit Range	Туре	Reset	Description
Undefined	31:13	N/A	N/A	Bits 31:13 have no effect.
Transmitter FIFO Overflow Interrupt Mask Status	12:12	Write to Clear	0x0	This event is triggered whenever a new word is pushed into the transmit FIFO when there is not enough room for all the data. This will be set because of any write when the Transmitter FIFO Nearly Full flag in Channel Status Register is already set, or a double byte write when the Transmitter FIFO Nearly Full flag in Channel Status Register is already set. Bit = 0: no interrupt occurred Bit = 1: interrupt occurred
Transmitter FIFO Nearly Full Interrupt Mask Status	11:11	Write to Clear	0x0	This event is triggered whenever a new word is pushed into the transmit FIFO causing the fill level to be such that there is not enough space for a further write of the number of bytes currently specified in the Character Size bits in the Mode register. If this further write were currently attempted, it would cause an overflow. Note that when Character Size is 00, this assumes that a two byte write would be attempted and hence a single byte write is still possible without overflow by driving byte select low for the write. Bit = 0: no interrupt occurred Bit = 1: interrupt occurred
Transmitter FIFO Trigger Interrupt Mask Status	10:10	Write to Clear	0x0	This event is triggered whenever a new word is pushed into the transmit FIFO causing the fill level to become equal to the value defined by Transmit FIFO Trigger Level register. Bit = 0: no interrupt occurred Bit = 1: interrupt occurred
Delta Modem Status Indicator Interrupt Mask Status	9:9	Write to Clear	0x0	This event is triggered whenever the Delta Clear to Send, Delta Data Set Ready, Trailing Edge Ring Indicator, or Delta Data Carrier Detect in the modem status register are being set. Bit = 0: no interrupt occurred Bit = 1: interrupt occurred
Receiver Timeout Error Interrupt Mask Status	8:8	Write to Clear	0x0	This event is triggered whenever the receiver timeout counter has expired due to a long idle condition. Bit = 0: no interrupt occurred Bit = 1: interrupt occurred
Receiver Parity Error Interrupt Mask Status	7:7	Write to Clear	0x0	This event is triggered whenever the received parity bit does not match the expected value. Bit = 0: no interrupt occurred Bit = 1: interrupt occurred
Receiver Framing Error Interrupt Mask Status	6:6	Write to Clear	0x0	This event is triggered whenever the receiver fails to detect a valid stop bit. Bit = 0: no interrupt occurred Bit = 1: interrupt occurred

Receiver Overflow	5:5	Write	0x0	This event is triggered whenever the contents of the
Error Interrupt Mask		to		receiver shift register have not yet been transferred
Status		Clear		to the receiver FIFO and a new start bit is detected.
				This may be due to the FIFO being full, or due to
				excessive clock boundary delays.
				Bit = 0: no interrupt occurred
				Bit = 1: interrupt occurred
Transmitter FIFO Full	4:4	Write	0x0	This event is triggered whenever a new word is
Interrupt Mask Status		to		inserted into the transmit FIFO causing it to go from
-		Clear		a non-full condition to a full condition.
				Bit = 0: no interrupt occurred
				Bit = 1: interrupt occurred
Transmitter FIFO	3:3	Write	0x0	This event is triggered whenever the final word is
Empty Interrupt Mask		to		removed from the transmit FIFO.
Status		Clear		Bit $= 0$ : no interrupt occurred
				Bit = 1: interrupt occurred
Receiver FIFO Full	2:2	Write	0x0	This event is triggered whenever a new word is
Interrupt Mask Status		to		inserted into the receive FIFO causing it to go from
-		Clear		a non-full condition to a full condition.
				Bit $= 0$ : no interrupt occurred
				Bit = 1: interrupt occurred
Receiver FIFO Empty	1:1	Write	0x0	This event is triggered upon exit of the final word
Interrupt Mask Status		to		from the receive FIFO.
*		Clear		Bit = 0: no interrupt occurred
				Bit = 1: interrupt occurred
Receiver FIFO Trigger	0:0	Write	0x0	This event is triggered whenever a new word is
Interrupt Mask Status		to		inserted into the receive FIFO.
Ĩ		Clear		Bit $= 0$ : no interrupt occurred
				Bit = 1: interrupt occurred

Receiver FIFO Empty Continuous Status	1:1	R/W	0x0	Bit = 0: Rx FIFO is not empty Bit = 1: Rx FIFO is empty
Receiver FIFO Trigger Continuous Status	0:0	R/W	0x0	Bit = 0: Rx FIFO fill level is less than Receiver FIFO trigger level Bit = 1: Rx FIFO fill level is greater than or equal to Receiver FIFO trigger level

## <u>UART\_T\_R\_FIFO (UART0: 0xE0000000 + 0x30; UART1: 0xE0001000 + 0x30) (UART)</u>

Name	Bit Range	Type	Reset	Description
Undefined	31:8	N/A	N/A	Bits 31:8 have no effect.
FIFO	7:0	R/W	0x00	Operates as Tx FIFO and Rx FIFO. Read/Write data from/to the FIFO.

## <u>UART\_Baud\_Div (UART0: 0xE0000000 + 0x34; UART1: 0xE0001000 + 0x34) (UART)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:8	N/A	N/A	Bits 31:8 have no effect.
Baud Rate Divider	7:0	R/W	0xF	Bits = $0 - 3$ : ignored
Value				Bits = 4 - 255: Baud Rate Divider value

#### <u>UART\_FCD</u> (UART0: 0xE0000000 + 0x38; UART1: 0xE0001000 + 0x38) (UART)

Name	Bit Range	Туре	Reset	Description
Undefined	31:6	N/A	N/A	Bits 31:6 have no effect.
RxFIFO Trigger Level for Ready to Send (RTS) Output Signal (EMIOUARTxRTSN) De-Assertion	5:0	R/W	0x00	Bits = 0 - 3: Flow delay triggering is disabled, since minimum 4-word hysteresis cannot be satisfied. Bits = 4 to 65535: EMIOUARTxRTSN is driven high when Rx FIFO fill level equals value in this register.

#### <u>UART\_TFIFO\_LVL</u> (UART0: 0xE0000000 + 0x44; UART1: 0xE0001000 + 0x44) (UART)

Name	Bit Range	Туре	Reset	Description
Undefined	31:6	N/A	N/A	Bits 31:6 have no effect.
Transmitter FIFO Trigger Level	5:0	R/W	0x20	Bits = 0: Disables transmitter FIFO trigger level function Bits = 1 - 63: Trigger set when transmitter FIFO fills to TTRIG bytes

# XADC Module [5]

### Description

XADC Wizard is an IP provided by Xilinx that can be used via Vivado. "The XADC hard macro data registers are 16 bits in width. The XADC hard macro specification guarantees the first 12 MSB bits accuracy; so only these bits are used for reference." [5] For more information about the registers refer to the XADC Wizard v3.3 Product Guide. Blackboard is configured by default so that PMODA pins JA2\_P/JA2\_N and JA3\_P/JA3\_N are configured for ADC inputs in hardware (see figure below). These pins will represent the VAUX\_P\_N\_13 and VAUX\_P\_N\_9 registers, respectively.

Figure 20 Blackboard Bank 35 pin layout

## **Overview of Registers**

Base Address + Offset (hex)	Register Name	Reset Value	Access Type	Description
		(hex)		
0x4BB06000 + 0x200	XADC_TEMP	N/A	Read	The 12-bit Most Significant Bit
				(MSB) justified result of on-device
				temperature measurement is stored
				in this register.
0x4BB06000 + 0x20C	XADC_Vp_Vn	0x0	Read/	Read: 12-bit MSB justified result
			Write	of A/D conversion on the
				dedicated analog input channel is
				stored in this register
				Write: Resets XADC hard macro.
				No specific data required.
0x4BB06000 + 0x264	XADC_VAUX_P_N_9	0x0	Read	The 12-bit MSB justified result of
				A/D conversion on the auxiliary
				analog input 9 is stored in this
				register.
0x4BB06000 + 0x274	XADC_VAUX_P_N_13	0x0	Read	The 12-bit MSB justified result of
				A/D conversion on the auxiliary
				analog input 13 is stored in this
				register.

## Registers

#### XADC\_TEMP (0x4BB06000 + 0x200) (XADC)

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
Temp Value	15:0	R	N/A	Reading from this address will return a 12-bit MSB raw on device temperature value. Actual temperature can be calculated using the following formula: $Temp = \frac{ADCdata}{65536 * 0.00198421639} - 273.15 (°C)$

### <u>XADC\_Vp\_Vn (0x4BB06000 + 0x20C) (XADC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
Vp/Vn Value	15:0	R	0x0	Reading from this address will return a 12-bit MSB raw voltage value. Actual voltage value can be calculated using the following formula: $Voltage = \frac{ADCdata}{65536} (V)$

#### <u>XADC\_VAUX\_P\_N\_9 (0x4BB06000 + 0x264) (XADC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
VAUX_P_N_9 Value	15:0	R	0x0	Reading from this address will return a 12-bit MSB raw voltage value. Actual voltage value can be calculated using the following formula: $Voltage = \frac{ADCdata}{65536}$ (V)

#### <u>XADC\_VAUX\_P\_N\_13 (0x4BB06000 + 0x274) (XADC)</u>

Name	Bit Range	Туре	Reset	Description
Undefined	31:16	N/A	N/A	Bits 31:16 have no effect.
VAUX_P_N_13 Value	15:0	R	0x0	Reading from this address will return a 12-bit MSB raw voltage value. Actual voltage value can be calculated using the following formula: $Voltage = \frac{ADCdata}{65536}$ (V)

```
Programming Example in C (XADC)
```

```
#include <stdio.h>
#include "unistd.h"
#define XADC DEVICE ID 0x4BB06000 // baseaddress
//Macro for Raw data value conversion to temperature
#define RawToTemperature(ADC raw data)\
             ((((float)(ADC raw data)/65536.0f)/0.00198421639f) - 273.15f)
// Macro for Raw voltage data value conversion to voltage
#define RawToVoltage(ADC raw data)\
             ((((float)(ADC_raw_data))* (1.0f))/65536.0f)
static int FractToInt(float FloatNumber); // fractions to integers
int main() {
      while(1) {
             float ExtVolData13,ExtVolData9, ExtintegerData;
             //Read the on-chip integererature Data
             uint32_t integerRawData = *((uint32_t *) XADC_DEVICE_ID +0x200/4);
             //convert the data to temp
             ExtintegerData = RawToTemperature(integerRawData);
             //Read the external Vaux7 Data
             uint32_t VolRawData9 = *((uint32_t *) XADC_DEVICE_ID +0x264/4);
             ExtVolData9 = RawToVoltage(VolRawData9); // convert data to voltage
             //Read the external Vaux14 Data
             uint32_t VolRawData13 = *((uint32_t *) XADC_DEVICE_ID +0x274/4);
             ExtVolData13 = RawToVoltage(VolRawData13); // convert data to voltage
             printf("\r\n%0d.%03d [C],%0d.%03d[V],%0d.%03d[V] ",
                          (int)(ExtintegerData), FractToInt(ExtintegerData),
                          (int)(ExtVolData9), FractToInt(ExtVolData9),
                          (int)(ExtVolData13), FractToInt(ExtVolData13));
             usleep(500000); //wait 500ms
      }
      return 0;
}
int FractToInt(float FloatNumber) {
      float integer;
      integer = FloatNumber;
      if (FloatNumber < 0) {</pre>
             integer = -(FloatNumber);
      }
      return( ((int)((integer -(float)((int)integer)) * (1000.0f))));
}
```

# **Revision History**

Date	Version	Revision
8/13/2018	2.2.0	<ul> <li>Logo Update</li> <li>XADC Register Update</li> <li>RGB_LED module update (registers updated and PWM example updated)</li> <li>Fixed Interrupt controller register linking problems</li> <li>Version changed to align with Hardware Definition File</li> </ul>
4/6/2018	2.1.7	<ul> <li>Updated table of contents, fixed minor typos in the register description</li> </ul>
3/2/2018	2.1.6	<ul> <li>Added I2C Interface registers</li> <li>Changed MIO Buttons C-code example (added write unlock key code)</li> <li>Added LM75B register descriptions and added citations</li> </ul>
2/21/2018	2.1.5	<ul> <li>Added SPI Module's registers</li> <li>Added NAV Sensor Module's Registers</li> <li>Linked all module register to the "overview of registers"</li> </ul>
2/14/2018	2.1.4	<ul> <li>Added more registers needed for interrupt configuration</li> <li>Added UART interface registers</li> </ul>
2/12/2018	2.1.3	<ul> <li>Added GTC Module's, MIO Configuration's, GPIO Module's sections (overview of register and descriptions of registers, programming examples)</li> </ul>
2/9/2018	2.1.2	<ul> <li>Added ARM GIC Register Information and Programming examples in C</li> <li>Fixed minor typos</li> </ul>
1/18/2018	2.1.1	<ul> <li>Minor wording changes/fixes.</li> </ul>
1/17/2018	2.1.0	<ul> <li>.hdf file changes: Mic and speaker pins switched in xdc file(fixed now), Xilinx IP updates.</li> <li>XADC Module updated, fixed register size;</li> <li>Re-alignment of the header; and</li> <li>Added Revision History Section.</li> </ul>
12/28/2017	2.0	<ul> <li>Version changed to 2.0 to align with Hardware Definition File Version;</li> <li>.hdf file changes: LED module clock enable register removed and combined with MODE bit.</li> </ul>
12/18/2017	1.0	<ul> <li>Initial Blackboard Programmer's Reference Release</li> </ul>
